Sustainable agricultural development is one of the most powerful tools to end extreme poverty and boost shared prosperity. Agriculture is the economic and social mainstay of some 500 million smallholder farmers, and in developing countries, the sector is the largest source of incomes, jobs and food security. Sustainable, inclusive growth in the agriculture and food sectors creates jobs—on farms, in markets, cities, towns and villages, and throughout the farm-to-table food production and consumption chain.

Seen against the backdrop of an increasing world population that is expected to reach nine billion by 2050, rising food demand is estimated to increase by at least 20% globally over the next 15 years with the largest increases projected in Sub-Saharan Africa, South Asia and East Asia. Boosting the productivity, profitability and sustainability of agriculture is essential for fighting hunger and poverty, tackling malnutrition and boosting food security. In short, the world needs a food system that can feed every person, every day, everywhere with a nutritious and affordable diet, delivered in a climate-smart, sustainable way.

To achieve this goal, we need to be more productive and efficient in the way we grow food, while building the resilience of both farmers and food supply chains while simultaneously reducing the environmental footprint of the agriculture and food sectors. This process requires policies and regulations that foster growth in the agriculture and food sectors, well-functioning markets, and thriving agribusinesses that make more food available in rural and urban spaces.

In pursuit of these objectives, we are pleased to present the World Bank Group’s *Enabling the Business of Agriculture (EBA) 2017*, the third in a series of annual reports. The predominant focus of the EBA project is to measure and monitor regulations that affect the functioning of agriculture and agribusinesses. This year’s report provides analysis and results for 62 countries representing all regions and income groups, and covers the following topic areas: seed, fertilizer, machinery, finance, markets, transport, information and communication technology, and water. Two additional topics—land and livestock—are being developed, and initial results are presented in this report. Two overarching themes—gender and environmental sustainability—are included in the EBA analysis with a view to promoting inclusive and sustainable practices.

Despite the inherent complexity of agricultural systems and the differing regional and country contexts in which agriculture and agribusiness performance needs to be evaluated, globally comparable data and indicators offer meaningful tools that can enable countries, policy makers and stakeholders to identify barriers that impede the growth of agriculture and agribusinesses, share experiences and develop strategies to improve the policy environment anchored in local contexts. The EBA indicators and analysis presented here not only help strengthen the information base that can be used for informed policy dialogue but can also encourage regulations that ensure the safety and quality of agricultural inputs, goods and services while minimizing costs to make more food available to more people.

Robust, effective and efficient regulatory systems are essential components of well-functioning agriculture and food markets. In turn, such systems can help achieve the twin goals of the World Bank Group—ending poverty by 2030 and boosting shared prosperity—as well as the Sustainable Development Goals. In keeping with the objectives of earlier reports, we offer these findings as a public good that can help advance knowledge and understanding of the critically-important role that the agriculture and food sectors can play in accelerating sustainable development for the benefit of all.

Enabling the Business of Agriculture 2017 was prepared under the leadership of Preeti S. Ahuja and Federica Saliola, with the support of César Chaparro-Yedro, Tea Trumbiç and Farbod Youssefi, working under the general direction of Augusto López-Claros, Ethel Sennhauser and Juergen Voegele. During this cycle, Farbod Youssefi led the operationalization of the Enabling the Business of Agriculture indicators, working with client facing teams across a number of Agriculture Global Practice client countries. The team would also like to acknowledge the support of Melissa Johns. Current and former team members included Yulia Amanbaeva, Dinah Bengur, Liwam Berhane, Arturo Francisco Bonilla Merino, Lila Melissa Cardell, Rong Chen, Dariga Chukmanova, Davida Louise Connon, Cyriane Coste, Klaus Deininger Nealon Devore, Sarah Diouri, Raian Divanbeigi, Soha Eshraghi, Leopoldo Fabra, Pilar Fernández, Felix Ferwer, Fernanda Barros Gabbert, Arnau Gallard-Agusti, Bill Garthaaita, Tulia Gattone, Slavena Georgieva, Lucia Gruet, Graham Hamley, Maureen Itepu, Edna Massay Killon, Marina Kayumova, Milan Kondić, Maksat Korooluev, Alva Kretschmer, Robert de l’Escalle, Jean Philippe Lodugnon Harding, Wisambi Loundu, Valerie Marchal, Thibault Meillard, Julia Navarro, Esperanza Pastor Núñez de Castro, Nina Paustian, Aditi Poddar, Ana María Santillana Farakos, Sara Savastano, Kateryna Schroeder, Justin Lee Schweger, Gabriel Simoes Gaspar, Bungheng Taing, Samjhana Thapa, Geyi Zheng and Yucheng Zheng.

Assisting with data collection were: Joshua Ahyong, Rebecca Louise Barnes, Vinicius Beraldo, Sabhanaz Siddharth Dixit, Rashid Diya, Ranjia Duan, Fadia Hayee, Luka Kalandarishvili, Kenan Karakulah, Garri Kasparov, Yousra Khalil, Gregory La Rocca, Atul Menon, Behrad Nazarian, Teresa Peterburs, Lochard Philozin, Jason Pierce, Gaurav R. Pradhan, Rustam Rakhmetov, Juan Manuel Ramírez Roldán, Leekyung Shim, Charnea Supplee, Nan Tang, Alexander Troncoso, Xinyu Weng, Kristina Wienhofer, Dou Zhang and Yang Zhao. The team is grateful to local consultants who supported data collection or helped the team during country visits: Faiza Hesham Hael Ahmed (Jordan), Kali Sankar Ghosh (India), Jocellin Kye Hoan Lee (Republic of Korea), Krit Pattamaroj (Thailand) and Macarena Vio (Chile).

Punam Chuhan-Pole, Richard Colback, Carlos A. da Silva, Andrais Horvai, Ed Keturakis, Oksana Nagayets, Harideep Singh and Patrick Verissimo reviewed the full draft report and provided feedback. The team received additional written comments from Oliver Braedt, Juan Buchenau, Poonam Gupta, Julian Lampietti, Daniel Lederman, Mohamed Medouar, Michael Morris, Balakrishna Menon Parameswaran, Sajjad Ali Shah, Raju Singh, Adama Toure and Martien Van Nieuwkoop. The team is also grateful for valuable comments and reviews provided by colleagues across the World Bank Group, in particular those in the 62 World Bank Group country offices and those working on several key areas investigated by the report.

The team would especially like to acknowledge the hard work of the following individuals in the country office who helped distribute questionnaires and validate the data: Asma Ben Abdallah, Abimbola Adubu, Arusyak Alaverdyan, Mustafa Alver, Amadou Ba, Mariam Bamba, Julia Barrera, Husam Beides, Sylvie Bossoutrot, Blessings Botha, Melissa Brown, Nabil Chaheri, Mudita Chamroen, Ladsy Chengula, Purna Bahadur Chhetri, Youjin Choi, Kevin Croxford, Catherine Doody, Svetlana Edmeades, Yanina Ermakova, Time Hapana Fatch, Noreen Grace Fernandes, Xavier Furtado, Augusto Garcia, Andrew Goodland, Sameer Goyal, Artavazd Hakobyan, Alexandra Horst, Gheeeun Jang, Chakib Jenane, Kwang Chul Ji, Frauke Jungbluth, Min Jae Kang, Katie Kennedy Freeman, Wansup Kim, Hans Kordik, Sobir Kurbanov, Soo Yeon Lim, Thomas Lubeck, Omar Lyasse, Seenithamby Manoharan, Chanshoom Manythong, Mohamed Medouar, Michael Morris, Aimee Mpambara, Joyce Msuya, Linda Mukwavi, Alex Mwanakasale, Valens Mwumvaneza, Srinivasan Ananthan Nagalpa, Jan Nijhoff, Aifa N'Doye Nione, Dorota Agata Nowak, Patience Nyenpan, Francisco Obreque, Pierre Olivier, Balakrishna Menon Parameswaran, Fernando Paredes, Manivannan Pathy, Doina Petrescu, Lodira Pirmanova, Tatyana Ponomareva, Maria Theresa Quinones, Tim Robertson, Marina Sahakyan, Sheu Salau, Yeyande Sangho, Elena Savinova, Manievel Sene, Bekzod Shamsiev, Animesh Shrivastava, Sarah Simons, Rita Soni, Heinz Streubehof, Raquel Orejas Tagarro, Hardwick Tchale, Talimjan Urazov, Bela Varma, Griselle Felicita Vega, Son Tanh Vo, Bobojobin Yatimov and Sergiy Zorya.

The team also benefited from comments and discussions with experts from both inside and outside the World Bank Group. The team is especially grateful to Simeon Djankov, who provided extensive comments on the report draft and methodology. Comments were also received from: Ulrich Adam, Guillaume Agede, Esteban Alcáde, Oya Pinar Ardıc Alper, Jamie Anderson, Patrice Annequin, Maria Antip, Joshua Ariga,
The Enabling the Business of Agriculture program was developed in partnership with several donors, whose funding and support makes this report possible: the Bill and Melinda Gates Foundation, the Department for International Development (DFID), the Danish Ministry of Foreign Affairs, the United States Agency for International Development (USAID) and the Government of the Netherlands.

The Enabling the Business of Agriculture 2017 outreach strategy is being executed by a communications team led by Indira Chand and Sarwat Hussain, supported by Zia Morales. The development and management of the Enabling the Business of Agriculture website and technical services were supported by Andrés Baquero Franco, Fengsheng Huang, Kunal Patel, Vinod Kumar Vasudevan Thottikkatu and Hashim Zia.

The report was edited by Dina Towbin and designed by Base Three LLC.

Enabling the Business of Agriculture 2017 benefited from the generous input of a network of more than 3,932 local partners, including legal experts, business associations, private sector representatives, farmers’ organizations, academics, government officials and other professionals actively engaged in the policy, legal and regulatory requirements in the 62 countries covered this year. Please note that the data published in the report and online represent a unified response based on the answers the team received from various respondents and sources, and are not attributed to any particular respondent. Wherever possible, answers were corroborated by official fee schedules, laws, regulations and public notices. The names of those wishing to be acknowledged individually are listed at the end of the report and are available at: http://eba.worldbank.org.
About Enabling the Business of Agriculture
Since 2013, *Enabling the Business of Agriculture* (EBA) has collected data on laws and regulations that impact the business environment for agriculture. The analysis has yielded some important results, such as: EBA country data have been used to open dialogues on regulatory reform with governments across several countries in Sub-Saharan Africa and East Asia; indications of interest from other development agencies in joining forces with the World Bank; engagement with a range of vital stakeholders from the private sector to civil society to academia; and continued enhancement of the methodology.}

*Enabling the Business of Agriculture 2017* is the third report in the series. The data can be used by governments, investors, analysts, researchers and others interested in this component of the enabling agribusiness environment to assess countries’ performance on the topics measured, as well as to identify regulatory good practices that can be found around the world.

*Enabling the Business of Agriculture* builds on the *Doing Business* methodology and quantifies regulatory practices and legal barriers that affect the business of agriculture. *Doing Business* has pioneered a unique approach for comparing countries’ performances on the regulatory environment; the results are noteworthy—more than 2,900 regulatory reforms have been documented since 2004 in 190 countries around the world. But the *Doing Business* focus has been on small and medium enterprises located in the largest business cities. Businesses that operate in and around agriculture face additional constraints to enter and operate in the market and often deal with stricter regulatory controls related to registration and quality control of their service and/or goods. Recent shifts in population and food demand have made it all the more paramount that a country’s regulatory frameworks and institutions enable farmers to produce and deliver more and safer food.

**How does regulation impact the agriculture sector?**

What can governments do to improve the access of farmers to essential inputs and services that increase their productivity in an environmentally sustainable manner? How can smallholders be helped to raise their socio-economic well-being while facilitating their integration with value chains? What can governments do to facilitate entrepreneurs and agribusinesses to thrive in a socially and environmentally responsible way?
Governments can help by establishing appropriate regulatory systems that ensure the safety and quality of agricultural goods and services without being costly or burdensome overall so as to discourage firms from entering the market. Excessive regulation makes firms move to the informal economy\[3\] and generates high unemployment.\[3\] Poorly-designed regulations impose high transaction costs on firms thus reducing trade volumes,\[4\] productivity\[5\] and access to finance. Creating an enabling environment for agriculture is a prerequisite to unleash the sector’s potential to boost growth, reduce poverty and inequality, provide food security and deliver environmental services.\[5\] Among other factors, government policies and regulations play a key role in shaping the business environment through their impacts on costs, risks and barriers to competition for various players in the value chains.\[7\] By setting the right institutional and regulatory framework, governments can help increase the competitiveness of farmers and agricultural entrepreneurs, enabling them to integrate into regional and global markets.

Over the past decade a branch of economic literature has highlighted the significant impact of business regulations on economic performance.\[8\] It is crucial to have regulations that can lower risk by enabling farmers to operate in a context where the outcomes of their decisions are more predictable. Governments need to strike the right balance between correcting market failures through regulations and minimizing the costs that those regulations impose on economic agents. This balance is essential for agriculture, but it is also particularly challenging. It is not unusual for governments to implement too-stringent agricultural regulations,\[9\] which impose excessive compliance costs for agricultural firms and make them more prone to remaining (or becoming) informal.\[10\] The agriculture sector’s dependence on land, which is a finite resource and binds its growth to productivity gains, underscores the impact of regulations on areas such as land tenure and price volatility. Farmers face considerable risk due to their susceptibility to exogenous elements and from extreme or erratic weather, insects, rodents and other pests, and diseases. What’s more, this uncertainty is exacerbated by the inherent volatility of agricultural markets.\[11\]

Reducing transaction costs imposed by regulations is imperative in agriculture. Transport costs can make up one-third of the farm gate price in some Sub-Saharan African countries and can prevent farmers from specializing in the goods where they have a competitive advantage.\[12\] In addition to transport, improving access to reliable and affordable information and communication technology (ICT) services is vital to a global food and agriculture system that is able to achieve its potential.

Regulations that can lower risk by enabling farmers to operate in a context where the outcomes of their decisions are more predictable are crucial. In fact, successful regulatory reform has contributed to increased supply and lower prices in the seed and mechanization markets in Bangladesh and Turkey, in the fertilizer sector in Bangladesh, Kenya and Ethiopia, and in the maize industry in Eastern and Southern Africa, among others. A series of legal, institutional and administrative reforms in the 1990s led to a wide range of improvements in Mexico’s water resource management. Vietnam introduced Land Use Rights Certificates in 1993, which increased the security of land tenure for farmers and gave rise to more land area devoted to long-term crops.

Agricultural production has unique and evolving dimensions through which it interacts with relevant laws and regulations. These dimensions include, for example, regulations of agricultural input markets such as seed and fertilizer, and regulations that enable small-scale and remote farmers to access finance as well as quality, sanitary and phytosanitary standards and trucking licenses.\[13\]

**What does Enabling the Business of Agriculture measure?**

*Enabling the Business of Agriculture 2017* presents data that measure legal barriers for businesses operating in agriculture in 62 economies and across 12 topic areas. It provides quantitative indicators on regulation for seed, fertilizer, machinery, finance, markets, transport, water, and ICT (table 1). Two overarching themes—gender and environmental sustainability—continue to be included in the report analysis to ensure that the messages developed by EBA encourage inclusive and sustainable practices. This year scoring was piloted for the land topic for 38 countries in which data were collected. The data for the remaining 24 countries will be collected next year and the team will refine the methodology further. EBA also collected data on the livestock topic, focusing on veterinary medicinal products (VMPs). The report explains the methodology and provides some insight from data collection for VMPs, but future editions will expand the topical coverage to include the areas of animal feed and genetic resources.

Two types of indicators emerge: *legal indicators* and *efficiency indicators*. *Legal indicators* are derived from a reading of the laws and regulations. In a few instances, the data also include some elements which are not in the text of the law but relate to implementing a good regulatory practice—for example, online availability of a fertilizer catalogue. *Efficiency indicators* reflect the time and cost imposed by the regulatory system—for example, the number of procedures and the time and cost to complete a process such as certifying seed for sale in the domestic market. Data of this type are built on legal requirements and cost measures are backed by official fee schedules when available.

|                    | > Non-discrimination provisions  |

Sources: EBA database; Doing Business database.
How are EBA indicators selected?

The choice of the indicators developed for the eight scored topics was guided by a review of academic literature. The scoring choices of each indicator were informed by extensive consultations with key stakeholders, including civil society organizations, partner institutions, practitioners, public and private sector representatives, researchers and technical experts. The team is working on developing background papers for each topic to establish the importance of the regulations that EBA measures in each topic area for important outcomes such as agricultural output.

The Enabling the Business of Agriculture methodology provides a quantitative assessment of the regulations in each of the selected topics. The methodology, however, considers more than the number of regulations and does not promote deregulation. For example, higher scores are given for stricter labeling and penalty rules related to fertilizer or seed quality control since the laws and regulations need to set appropriate standards in these areas to ensure health and food safety. Higher scores are also given for the efficient application of regulations, such as affordable and timely tractor registration requirements. Countries that perform well on the EBA topics are those that balance proper enforcement of safety and quality control while avoiding burdensome and costly requirements that could discourage private sector development.

Going forward, it is envisaged that the selection of topics and related indicators will build on the current indicators and include the following additional measures: expansion of the livestock topic to include areas of animal feed and genetic resources; expansion of the gender cross-cutting area; refinement of the land scoring methodology; and development of an “Implementation Efficiency Index” to complement and provide additional policy insights alongside the current regulatory indicators. The refinement and selection of indicators will undergo a thorough internal review and collect feedback from various stakeholders from within the World Bank Group as well as from external participants. Already in place is a broad-based technical advisory committee with specialists from the private sector, academia, governments and the World Bank Group.

How are countries selected?

Enabling the Business of Agriculture 2017 covers 62 countries in seven regions (map 1). Selection criteria have been used to determine the countries included in the study, ensuring adequate representation of all regions and different levels of agricultural development. To select a sample of countries where an assessment of regulatory framework for agribusiness would be meaningful, the team did an analysis of the agriculture sector’s importance by looking at two contributions—to GDP and to employment. Countries with small agricultural sectors (defined as less than US$1 billion) were excluded unless the population employed in agriculture is more than 100,000 people. The countries were then grouped by geographic regions (using World Bank Group regions).
Bank country classifications) and agricultural transformation (grouping inspired by the World Development Report 2008). This process produced the following geographic groups: Eastern Europe and Central Asia; East Asia and Pacific; Latin America and the Caribbean; Middle East and North Africa; South Asia; Sub-Saharan Africa; and Organisation for Economic Co-operation and Development (OECD) high-income countries. The agricultural transformation groups developed are defined as either: agriculture-based countries (where agriculture employs more than 25% of the workforce and agriculture value added contributes more than 25% to the GDP); transforming countries (where agriculture employs more than 25% of the workforce and agriculture value added contributes less than 25% to the GDP); or urbanized countries (where agriculture employs below 25% of the workforce and agriculture value added contributes less than 25% to the GDP).

In selecting the first 10 pilot countries, and for subsequent expansion of the dataset to 40 and to 62 countries this year, the team aimed to include as many agriculture-based, pre-transition and transition countries, with a few important urbanizing and high-income countries from diverse geographical regions to allow EBA to measure and showcase good regulatory practices for each of the topic areas.

### How is the distance-to-frontier score calculated?

A significant development in this year’s report is the refinement of the scoring methodology. For the first time, Enabling the Business of Agriculture 2017 presents both topic scores, using the distance-to-frontier (DTF) method pioneered by Doing Business and topic rankings. The DTF score benchmarks countries with respect to regulatory best practice, showing the absolute distance to the best performance on each Enabling the Business of Agriculture indicator, and can help in tracking the countries’ absolute level of performance and how it improves over time. The DTF score measures the distance of each country to the frontier, which represents the best performance observed in each indicator for eight Enabling the Business of Agriculture topics (seed, fertilizer, machinery, finance, transport, markets, water and ICT). For legal indicators, the frontier is set at the highest possible value, even if no country currently obtains that score. For efficiency indicators, the frontier is set by the highest performing country.

Enabling the Business of Agriculture uses a simple averaging approach for topic indicator scores to arrive at the topic score. Each topic measures different elements of the enabling agribusiness environment and the DTF scores and rankings for each topic vary considerably. Colombia, for example, has a DTF score of 92.10 for finance, 88.89 for ICT, 85.52 for water and 81.58 for fertilizer—indicating it is very near the frontier in these topics (see table 2). At the same time, it has a DTF score of 73.92 for transport, 70.08 for markets, 63.19 for seed and 38.16 for machinery—showing areas where better regulatory practices can be adopted.

The topic DTF scores are sorted from highest to lowest and assigned a ranking from 1 to 62. The ranking complements the distance to frontier by providing information on the country’s performance on EBA topics relative to the other countries’ performance on the indicators in this particular year. It should be noted, given the composition of the indicators, that the scores and rankings are measurements of a particular set of regulations and do not necessarily assess the sum of all elements that shape the regulatory framework studied.

### How are the data collected?

Enabling the Business of Agriculture indicators are based on primary data collection through standardized questionnaires completed by expert respondents in each country as well as the team’s own analysis of the relevant laws and regulations. Once the data are collected and analyzed, several follow-up rounds address and clear up any discrepancies in the answers the respondents provide, including conference calls, written correspondence and country visits. Each year the team travels to the countries where it is hardest to collect data remotely. For the last two years, the

Source: EBA database.
team has traveled to about 20% of the sample countries. During the EBA2017 data collection period, the team visited these 13 countries: Armenia, Côte d’Ivoire, India, Jordan, Republic of Korea, Kyrgyz Republic, Liberia, Malawi, Morocco, Nepal, Russian Federation, Sri Lanka and Tajikistan. The data are then reviewed using desk research and follow-up with respondents. The preliminary data are validated through World Bank focal points in each country office. The data are then aggregated into indicators which allow for further analysis and comparisons, and contribute to the report writing phase. The report undergoes peer review with internal and external reviewers, as well as all relevant global practices and regions before it is released to the public (figure 1).

Chosen from the private sector, the public sector and civil society, respondents include firms, academia, financial institutions, professional associations, farmer organizations and government ministries and agencies. These individuals and organizations are chosen because of their knowledge of their countries’ laws and regulations. Involving various experts increases the data accuracy by balancing the possible biases of different stakeholders. Reaching out to both the private and public sectors helps compare the perspectives of all parties. Those wishing to be recognized are acknowledged in the Local Experts section at the end of the report.

Enabling the Business of Agriculture data are collected in a standardized way to ensure comparability across countries and over time. Following the methodological foundations of Doing Business, questionnaires use a standard business case with assumptions about the legal form of the business, its size, its location and the nature of its operations for each topic applied for all countries (table 3). Assumptions guiding respondents through the completion of the survey questionnaires vary by topic (see appendix B). In addition, in the interest of comparability, the values in the assumptions are not fixed values but proportional to the country’s gross national income (GNI) per capita. The data in this report are current as of June 30, 2016, and do not reflect any changes to the laws or administrative procedures after that date.

What does Enabling the Business of Agriculture not measure?

Many elements affect a country’s enabling environment for agribusinesses. The political situation in a country, for example, can greatly influence its attractiveness to business and investors. Social aspects, such as literacy and overall education levels and life expectancy, are also important indicators. A country’s economic performance, measured by factors such as inflation, unemployment, income growth, government revenues and expenditures, is also very influential when determining a country’s overall enabling environment. In many countries around the world, foreign exchange restrictions can be a major impediment to doing business. These factors are not captured by the Enabling the Business of Agriculture indicators but are well covered by other data initiatives that should be used together with the data presented to present a fuller picture of the enabling environment.

In many developing countries, many aspects of agricultural activity, from employment to the production and sale of goods, occur through informal channels. Burdensome regulations and lack of transparency, could be one reason for this, as could the quality of institutions, extension services and physical infrastructure. For example, regardless of the quality of transport regulations, lack of road infrastructure is a major barrier to transporting agricultural goods from the farm to markets. However, these elements are also not measured by the Enabling the Business of Agriculture indicators.

Enabling the Business of Agriculture has deliberately chosen to focus the indicators presented in this report on measuring laws and regulations that affect agribusiness firms that provide agricultural inputs, goods and services. The indicators constructed reflect elements that are under the direct influence of the government and can be compared across countries.

The chosen methodological approach has its benefits and limitations. The data presented are comparable and based on standardized assumptions. This methodology has proven to be successful in stimulating reform activity and allows countries to compare their performance on specific areas to other countries but also to monitor progress over time. Using standardized scenarios, however, can generalize and exclude some important context-specific information. To address some of these limitations, the data presented in this report and any recommendations that stem from it must be interpreted together with other important datasets as well as country relevant information.

What’s next?

Enabling the Business of Agriculture 2017 presents scored indicators for eight topics in 62 countries around the world and introduces initial data collected for livestock, land, gender and environmental sustainability. The team will use the 2017 year to disseminate the data and findings, refine and synthesize indicators, expand topic and country coverage, and hold discussions with various stakeholders on the best ways going forward. The main areas for development identified relate to strengthening the processes for obtaining relevant feedback on: indicator
Figure 1 | Data collection, review and analysis

- **January (01)**: Questionnaire Design
  - Questionnaires emailed to respondents in countries
  - Data collected by email and telephone
  - Country visits to verify data and recruit respondents

- **February to May (02)**: Data Collection
  - Desk review of available resources, including country laws and reports
  - Follow-up with respondents to verify data
  - Data quality checked
  - Data shared for validation with World Bank country offices

- **June to August (03)**: Data Review
  - Writing of key findings
  - Peer review of report and data
  - Decision meeting and clearance by World Bank management

- **September to October (04)**: Data Analysis
  - Data aggregated using scoring rules to create indicators
  - Data trends identified
  - Methodology refined

- **October to December (05)**: Report Writing and Review
  - Data shared for validation with World Bank country offices

- **February (06)**: Public Release of Report and Data
  - Dissemination of report and country engagement

- **Title**: About Enabling the Business of Agriculture

- **About**: Enabling the Business of Agriculture
development and refinement; country selection and criteria used for future scale up; identifying countries where subnational analysis would be relevant and developing a subnational methodology.

Future reports will allow the team to monitor progress of countries in each of the topic areas by tracking regulatory reforms that affect the indicators measured. Country coverage is also expected to expand and eventually cover between 80 and 100 countries.

Feedback is welcome on the data, methodology and overall project design to make future Enabling the Business of Agriculture reports even more useful. Feedback can be provided on the project website: http://eba.worldbank.org.

</tbody>
</table>
### MARKETS

**The business:**
- Performs general agricultural trading activities.
- Does not directly engage in agricultural production, processing or retail activities.
- Does not operate in a special export processing zone.

**The export product and trading partner:**
- Is a combination of a plant-based agricultural product group and a partner country which represents the highest five-year average export value, based on UN Comtrade 2009–13 data.

**The shipment:**
- Is transported via a 20-foot full container-load.
- Weighs 10 metric tons or US $10,000, whichever is most appropriate.
- All packing material that requires fumigation (such as wood pallets) is assumed to be treated and marked with an approved international mark certifying that treatment.

### TRANSPORT

**The business:**
- Is a private business entity or natural person whose core business is transporting goods by road for commercial purposes.
- Has met all formal requirements to start a business and perform general industrial or commercial activities.
- Has a maximum of five trucks; each truck has two axles and a maximum loading capacity of 15MT (metric tons). Trucks comprise a traction unit and a trailer.
- Transports agricultural products within the country, including perishable products. It does not transport fertilizers, pesticides, hazardous products or passengers.
- Carries out cross-border transport services with its largest agricultural border-adjacent trading partner.
- The company’s main office is located in the country's largest business city.
- The trucks were first registered in the largest business city less than six months ago.
- All employed drivers have the domestically required driver’s license to drive a 15MT vehicle.

**The transported product:**
- Is based on UN Comtrade’s 2009–13 five-year average export value of major plant product groups.

**The cross border trading partner:**
- Is based on UN Comtrade’s 2009–13 five-year average trade value of major plant product groups, as well as on a border-adjacent criterion.

### WATER

**The water user:**
- Is a farm growing crops.
- Is a medium-size farm for the country, with land area that falls between 2 and 10 hectares.
- Uses mechanical means to individually abstract water for irrigation.
- Is not located in a broader irrigation scheme.

**The water source:**
- Is a river located 300 meters away from the farm; or
- Is a groundwater well located on the farm.

### ICT

**The mobile operator:**
- Is a private company.
- Provides telecommunications services such as voice, SMS (Short Message Service) and data.

---

**Note:**

a. If maize varieties are not being developed by the private sector in the country, an imported maize variety is considered, which may have been previously registered elsewhere.

b. High level of financial inclusion is defined as those countries that score 0.8 or higher, as measured by the average of the normalized value of the FINDEX variables "account at a financial institution (% of rural adult population)" and "account at financial institution (% of adult population)." Countries under this classification are as follows: Denmark, Greece, Italy, Korea, the Netherlands and Spain.

c. If medium-size farms in the country, as prescribed in any official farm-size classification system, deviate significantly from this given range, any exemption from permit requirements that may otherwise apply to small farms (for example, exemptions for smallholders or subsistence farmers) are not considered.

d. The choice between surface water and groundwater as a source for irrigation water is made based on the predominant irrigation water source for the country, based on the most recent available data from FAO Aquastat for the percentage of area equipped for irrigation by surface water and groundwater.

</table>
Overview
The global food system plays a central role in meeting the World Bank Group’s twin goals of eliminating extreme poverty and boosting shared prosperity. Ending poverty will not be possible without raising the incomes of the rural poor, which account for 78% of poor people worldwide. Schultz remarks that “most of the world’s poor people earn their living from agriculture, so if we knew the economics of agriculture, we would know much of the economics of being poor.” Moreover, some 800 million people currently suffer from hunger across the globe and the demand for greater variety and better quality food from a growing, urbanized population continues to increase. Agriculture has a strong record as an instrument for poverty reduction and can lead growth in agriculture-based countries. In fact, growth originating from agriculture has been two-to-four times more effective at reducing poverty than that originating from other sectors.

To meet the challenges ahead, food systems must not only be able to provide food security to the growing world population but they must also deliver diverse, nutritious diets that are affordable and accessible to all. Improved agricultural productivity must be coupled with increased resilience to climate change and reduced greenhouse gas emissions. In addition, for agriculture to deliver on its full potential, value chains must be strengthened, smallholder linkages to markets improved and agribusiness expanded.

The agricultural sector is a significant source of employment, even as countries traverse different stages of agricultural structural transformation. Globally, 30% of all workers are employed in farming, while in low-income countries the share is 60%. As economies grow and develop, the importance of agribusiness relative to farming increases, leading to significant opportunities for employment growth and value added. Central to achieving this will be the investments, performance and success of key players across agricultural value chains—from farmers, to input and service providers, to large and small agricultural businesses.

Enabling the Business of Agriculture 2017 (EBA17) aims to foster a more conducive environment for agribusiness. By providing key data on regulatory frameworks that are globally comparable and actionable, it strengthens the information base that can be used for policy dialogue and reform. Such efforts can stimulate private sector activity and lead to more efficient and effective agricultural value chains.
EBA focuses on legal barriers for businesses that operate in agriculture in 62 countries and across 12 topics, including seed, fertilizer, machinery, finance, markets, transport, water, information and communication technology (ICT), environmental sustainability, gender, land and livestock. EBA’s dataset features two types of indicators (table 1.1). Legal indicators primarily reflect the text of laws and regulations and assess their conformity with a number of global regulatory good practices. Efficiency indicators measure the trans-action costs that firms have to bear to comply with national regulations on the ground. Transaction costs are expressed in time or monetary units, such as the time and cost needed to comply with requirements on agricultural exports.

After a pilot exercise conducted in 2013–14 covering 10 countries, EBA16 included 40 countries and six scored topics: seed, fertilizer, machinery, finance, markets and transport. In EBA17, country coverage is expanded to 62 countries with two new topics added to the scoring: water and ICT. In addition, efficiency indicators measuring transaction costs are expanded and scored for the first time.

### Countries with more agribusiness-friendly regulations

EBA scores countries based on both the quality and efficiency of their regulatory systems, through two aggregate measures per topic: (i) the distance-to-frontier (DTF) score or absolute distance of a country to the best performance on each topic (see appendix A); and (ii) the topic ranking that results from ordering DTF scores (see table 1.2).

Agriculture’s relevance varies significantly across countries. Based on the World Development Report 2008 and combining data on agriculture’s contribution to GDP and the share of active population dedicated to agriculture, EBA categorizes countries into three groups: agriculture-based, transforming and urbanized. Urbanized countries are on average at the frontier of good regulatory practices across all EBA topics (figure 1.1). They are followed by transforming countries. Agriculture-based countries have more room to improve the quality of their regulatory frameworks and decrease transaction costs. However, agriculture-based countries have shown on average a
better or similar performance compared to transform-
ing countries in the finance, water and transport topics
and are closing the gap on markets. Kenya, Malawi and
Mozambique have comprehensive legislation regulat-
ing water use permits. Burkina Faso, Côte d’Ivoire and
Ethiopia are among the top 10 countries in terms of the
efficiency in obtaining a cross-border trucking license.

Countries’ regulatory quality is associated with eco-
nomics growth11 and levels of development.12 High-
income countries have better agribusiness regulations
as measured by EBA,13 and this outcome is shown across
all topics. However, there are exceptions; some coun-
tries perform better on EBA indicators than what their
income level may suggest. That is the case of Vietnam
for fertilizer, machinery and transport; Kenya for seed,
finance, water and ICT; and Kyrgyz Republic for finance,
markets and machinery. On the other hand, despite its
very solid regulations on ICT operating licenses and
plant protection, Chile does not have a framework for
fertilizer registration or tractor type approval.

In terms of regions, OECD high-income countries have
on average the most agribusiness-friendly regulation
(figure 1.2). They all share regulation that promotes
quality control, facilitates trade and enables entry
and operations in agricultural markets. Spain ranks
among the top six countries globally in all eight EBA-
scored topics. However, OECD high-income countries
also have room for improvement. Romania is among
the top three performers globally in terms of regu-
lations for transport, machinery and ICT, but it takes
more than three years to register a new fertilizer
product, while the global average is below one year.

This performance is mainly due to field testing (not
required in best practice countries) and the delays
associated with the Gazette notification. Poland has
the most comprehensive and efficient regulations on
tractor operation, import, testing and standards, but
lacks a regulatory framework for warehouse receipts
to complement the existing collateral regime to obtain
a loan for agricultural production, as well as legislation
on deposit-taking microfinance institutions (MFIs).

Following OECD high-income countries, Europe and
Central Asia as well as Latin America and the Caribbean
regions show a number of good regulatory practices.
For example, all countries in Europe and Central Asia
have implemented good regulatory practices on tractor
imports, not requiring import permits or importers to
register in addition to their general business license. In
addition, both Bosnia and Herzegovina and Serbia are
among the top five countries globally in the fertilizer
area, due to best practice regulation on registration and
quality control. The fertilizer registration process
takes about one month in both countries, and costs
only 0.5% and 5.3% income per capita, respectively. The
Kyrgyz Republic ranks in the top 15 for markets and
machinery, showing efficient processes for exporting
agricultural goods and tractor registration, but it is
placed in the bottom 10 for seed and transport due to
the lack of regulations on seed quality control and
truck licenses. The Russian Federation performs
well in EBA’s machinery, water, and ICT topics.

Countries from Latin America and the Caribbean have
comprehensive regulation on financial inclusion and
water management. In fact, Colombia and Mexico score

Note: EBA countries are divided into three groups. Urbanized countries have a contribution of agriculture to GDP below 25% and a share of active population in agriculture below 25%; transforming countries have a contribution of agriculture to GDP below 25% and a share of active population in agriculture over 25%; agriculture-based countries have a contribution of agriculture to GDP over 25% and a share of active population in agriculture over 25%. The EBA17 distance-to-frontier (DTF) score is the average of the DTF scores of the following topics: seed, fertilizer, machinery, finance, markets, transport, water and information communication and technology (ICT). The correlation between EBA scores and agricultural transformation phase is 0.61.

Source: EBA database.
among the top 10 countries globally within these two topics. For example, Colombia has developed comprehensive rules enabling non-bank correspondents to provide financial services on behalf of a commercial bank; Mexico has developed a modern and comprehensive water regulatory framework anchored by the 1992 National Water Law, although some implementation challenges remain. Some countries in the region lag behind in several areas. Guatemala lacks a general framework for tractor type approval and registration, and trucking licenses, despite solid fertilizer quality control and plant protection regulations.

The regions lagging behind on EBA scores are: South Asia, Sub-Saharan Africa, and East Asia and Pacific. On average, countries from these regions have less than half of the regulatory good practices promoted by EBA. This situation mainly affects regulations related to quality control and operations in the different agricultural markets that EBA measures. It is most time-consuming to complete the process of exporting agricultural goods in Sub-Saharan African countries, taking 6.0 days on average, and the documents are most expensive in South Asia and Sub-Saharan Africa, costing 2.5% income per capita. The process for obtaining tractor type approval is the lengthiest and most expensive in South Asia (270 days and 604% income per capita, versus 21 days and 7% income per capita in East Asia and Pacific). This year EBA conducted a pilot study in India for all EBA topics to track subnational differences and will build on it for future data collection and analytical work (box 1.1).

In Sub-Saharan Africa, there is great variation across countries measured and topics. In the region, 7 of the 21 countries do not have a clearly designated government agency to conduct pest surveillance, and only Senegal and Tanzania have a publicly available database with information on plant pests and diseases. However, last year Sub-Saharan African countries adopted more regulatory reforms in plant protection than in other regions. Kenya is the best performer on EBA indicators in the region. It is among the 5 top performers in the water topic, thanks to a series of regulatory reforms on water resource management and a permit system that started in 2002 with the introduction of a new Water Act. On the other hand, the country still has great potential to improve its regulatory framework on fertilizer registration and plant protection, as well as to streamline the process related to exporting agricultural products. In East Asia and Pacific, Vietnam shares international best practices in the areas of fertilizer registration (from the legal and efficiency standpoint), efficiency of tractor registration and type approval, as well as trucking licenses both for domestic and cross-border transportation.

Benin, Arab Republic of Egypt, Haiti, Liberia, Myanmar, Sri Lanka and Sudan are the countries with the greatest room for improvement on average in all areas that EBA measures. For example, Haiti, Liberia and Myanmar (all conflict-affected countries) do not have any of the good regulatory practices on plant protection and very few in the areas of integrated water resource management, financial inclusion or trucking licenses.

Figure 1.2 | OECD high-income countries rank highest on EBA, followed by Europe and Central Asia, and Latin America and the Caribbean

![Chart showing EBA17 DTF score for different regions.](chart.png)

Source: EBA database.

Note: The EBA17 distance-to-frontier (DTF) score is the average of the DTF scores of the following topics: seed, fertilizer, machinery, finance, markets, transport, water and information communication and technology.
EBA and regulatory quality

The EBA overall DTF score provides a synthetic measure of the quality and efficiency of countries’ regulatory environment for agriculture. Its results are well correlated with other measurements of regulatory quality for the whole economy, such as the regulatory quality component of the Worldwide Governance Indicators (WGI) and Doing Business, which measures regulatory quality and efficiency for businesses that perform general industrial or commercial activities.

One potential criticism relates to the fact that what is written in the books does not necessarily reflect what happens in practice. In this regard, the relationship between EBA and the WGI rule of law component was analyzed and noted that where good regulatory measures are in place, laws also tend to be better enforced (figure 1.3).

Efficiency, quality control, operations and trade

Legal indicators in the eight EBA-scored topics can be distributed across three cross-cutting categories, namely: (i) operations indicators that measure the requirements for local companies to enter the market and develop agribusiness activities; (ii) quality control indicators that assess regulations governing plant protection, water resource management, safety standards for agricultural machinery and quality control associated with seed, fertilizer and truck operators; and (iii) trade indicators that measure

Box 1.1 | Subnational EBA study in India

For the first time, EBA conducted a subnational pilot study to assess how sensitive EBA indicators are to differences among different locations within a country. Four Indian states were selected: Bihar, Maharashtra, Odisha and Uttar Pradesh. For topics where EBA considers a case study that assumes that the company operates in the country’s largest business city, the following cities were selected on the basis of population data: Patna (Bihar), Mumbai (Maharashtra), Bhubaneswar (Odisha) and Lucknow (Uttar Pradesh). When discrepancies were found across Indian states in specific topics, Maharashtra data were considered as the proxy for India for the cross-country results presented in this EBA17 report.

The main result of this pilot study is that while the legal and regulatory framework for agriculture and agribusiness is largely harmonized across the country, some differences emerge regarding the implementation of administrative procedures by state-level or local government agencies.

Laws governing entry and operations, quality control and trade for fertilizer, machinery, seed, transport and finance are either federal or state-level with very similar provisions across states. For example, in the finance area, the Federal Guidelines for Engaging of Business Correspondents 2010 and the Payment and Settlement Systems Act 2007 apply to all Indian states, providing global best practice for the branchless banking indicator. However, financial cooperatives are governed by state-level laws; they are similar across the four states analyzed, lacking a deposit insurance system and disclosure requirements.

Some differences exist in the area of water and environment. Under India’s Constitution, water management is largely decentralized to the state level. Across the four states, only Odisha has established the legal foundation for a water use permit system that applies to farms that are medium-size or larger. In only two out of the four states (Maharashtra and Odisha) does the legal framework include mandates for the establishment of basin-level institutions, and only Maharashtra and Uttar Pradesh set a legal requirement for the preparation of basin plans and the creation and maintenance of a registry of water users. Within the environmental sustainability topic, plant genetic resources aspects are managed at the national level, but some differences persist in soil health management; namely, only Odisha and Maharashtra have a specific mandate for the development of land use plans. Other areas, such as producer organizations, are regulated by both central and state-level governments.

The time and costs to comply with government regulations vary across the four states in some EBA topics. For example, registering a tractor costs 500 Rupees and takes seven days in Bihar, while it costs only 200 Rupees and takes two days on average in Uttar Pradesh. Also the cost of tractor roadworthiness inspection is higher in Bihar (300 Rupees) than in the other three states (200 Rupees). The cost to obtain a truck-level state permit in Maharashtra is slightly lower (18,300 Rupees) than in Bihar, Uttar Pradesh (both at 20,000 Rupees) or Odisha (23,000 Rupees). While regulations related to plant protection and export documents remain national, phytosanitary certificates are issued by local government offices. There are other specific state-level licenses and permits, such as those related to domestic agricultural markets and inter-state transport.
Figure 1.3 | Higher EBA scores are associated with better performance in other measures of regulatory quality

![Graph showing correlation between EBA17 DTF score and WGI Rule of Law score, and EBA17 DTF score and WGI Regulatory Quality score.]

Sources: EBA database; Worldwide Governance Indicators.

Note: The correlation between the EBA17 distance-to-frontier (DTF) score and the rule of law score is 0.61. The correlation is significant at a 5% level after controlling for income per capita. The EBA17 DTF score and the regulatory quality score is 0.69. The correlation is significant at a 1% level after controlling for income per capita. The EBA17 DTF score is the average of the DTF scores of the following topics: seed, fertilizer, machinery, finance, markets, transport, water and information and communication technology.

Trade restrictions related to the export of agricultural products, the import of fertilizer and tractors, and cross-border transport rights. Efficiency indicators measure the time and cost needed to comply with the processes measured by EBA.

EBA indicators advocate for regulations that promote efficient regulatory processes that support agribusinesses while at the same time ensuring safety and quality control. The importance of the three cross-cutting EBA legal categories plus efficiency indicators has been clearly stated, however, it is not clear whether they are entirely compatible with one another or if success in one may come at the expense of another. Data show that rules that facilitate entry and operations in the market are compatible with regulations that promote safety and quality control (table 1.3). These rules are complements rather than substitutes. And countries with higher scores on operations and quality control tend also to have more effective trade requirements.

There is also a high correlation between the three legal dimensions combined (operations, quality control and trade) and the efficiency of the processes captured (figure 1.4), showing that solid regulatory frameworks tend to be present in countries that also have efficient processes. However, there are exceptions, for example: Malawi has laws related to seed and fertilizer registration containing some key elements on the books, but it is the country where it is most expensive to register both new seed varieties and fertilizer products. In Sri Lanka, on the other hand, while regulatory procedures such as tractor registration and trucking licensing are efficient and affordable, the country’s laws and regulations are not robust enough in some areas covered by EBA, as shown by the lack of legislation on agent banking activities or operation of warehouse receipts. Both the quality and the efficiency dimensions of business regulations, as captured by the EBA indicators, show significant correlations with countries’ agricultural productivity. On average, agricultural productivity is higher

Note: All correlations are significant after controlling for income per capita.
Each EBA indicator measures a different aspect of the agricultural regulatory environment. The DTF scores and associated rankings of a country can vary, sometimes significantly, across indicator sets. However, the correlation among any pair of EBA indicators is positive and ranges between 0.13 and 0.68. For example, solid and efficient rules on plant protection and trade in agricultural products are associated with better rules for importing and controlling the quality of essential agricultural inputs, such as fertilizer (figure 1.5). Reforms in different areas that EBA measures are complementary.

Nondiscriminatory measures

The design and implementation of nondiscriminatory and inclusive laws and regulations are key to encouraging competition, boosting investor confidence and facilitating agricultural investments in the long run. EBA data assess the existence of nondiscriminatory measures in agricultural laws and regulations that can assist domestic, foreign or small-scale private sector operators in doing business, as well as the ones that can promote women’s participation in certain agricultural activities. Such measures include allowing the private sector to register fertilizer, granting plant breeders’ rights or transport licenses based on the same rules for domestic and foreign applicants, establishing an affordable capital requirement to create a financial cooperative or creating a quota or mechanism to promote women’s participation in leadership roles in producer organizations (see appendix C).

Spain has in place the highest number of the nondiscriminatory measures in agriculture (figure 1.6). Out of the 29 good practices that EBA covered, more than 27 are included in its agricultural laws and regulations, with only a few legal obstacles that prevent domestic or small-sized companies from engaging in operations in the agriculture sector. Sub-Saharan African countries including Tanzania and Zambia are also among the top performers in this area. For example, there is no minimum capital requirement to establish a producer organization in Tanzania, and Zambia grants transport, backhauling, triangular and transit rights to foreign transport companies. On the other hand, countries such as Haiti, Malaysia and Myanmar have greater potential for improvement. For example, in Malaysia, foreign companies are not yet allowed to obtain a trucking license, and in Haiti, non-bank businesses cannot issue e-money.
Figure 1.6 | Spain has the most nondiscriminatory agricultural laws and regulations, while Haiti has the greatest potential for improvement

**Access to information**

Research suggests that easier access to regulatory information is associated with greater quality of business regulation and less corruption. Farmers and agribusinesses, many of them located in remote rural areas, could potentially save significant time and cost if they had the possibility to comply with administrative processes electronically or access information such as registries and official fees online.

EBA measures good practices related to the accessibility of information in the agriculture sector. These practices range from the availability of catalogues, databases and fee schedules that can inform the private sector of regulatory processes and help them make business decisions, to the provision of e-services including online issuance of the phytosanitary certificate or electronic application for the renewal of transport licenses, as well as legal obligations to disclose information including the effective interest rate of loans issued by financial cooperatives (see appendix C).

OECD high-income countries on average have the highest number of good practices related to access to regulatory information (figure 1.7). In all eight countries, there is publicly available information such as water resource monitoring results, regulated quarantine pest lists and official fee schedules for seed certification. In other regions, however, greater effort is needed to make regulatory information more accessible to the public. For example, in Sub-Saharan Africa and the Middle East and North Africa, where 24 countries were studied, half of the countries’ laws do not specify a method for calculating the water abstraction charge, and only Kenya and Mozambique currently have an online fertilizer catalogue.

**Putting EBA data in context**

EBA data are collected and analyzed following standardized case studies, and the same EBA indicators are presented for all 62 countries, aiming at ensuring comparability across countries and time. However, it is essential for policymakers to interpret EBA scores in conjunction with more detailed contextual information to better prioritize the policy areas in need of reform.

For example, among the potential contextual data available for water, the level of inter-annual water variability or the level of water stress could be important factors to consider when defining regulatory priorities on water resources management and permitting systems for irrigation water use, as measured by EBA. In certain cases, reform towards a more comprehensive legal framework could take on higher importance in countries with low EBA water scores and high inter-annual variability, such as Haiti, India and Jordan (upper-left quadrant of figure 1.8, in red), while it may not be the primary focus for countries with an already robust legal framework combined with smaller challenges related to inter-annual water resources variability, such as in Bosnia and Herzegovina, the Netherlands or Vietnam (lower-right quadrant of figure 1.8, in green).

EBA data also relate to the international context through the Sustainable Development Goals (SDGs), adopted by United Nations Member States to guide policies and regulations on the development agenda for the next 15 years. Agriculture connects all 17 SDGs and is at the core of SDG1 and SDG2, which call for ending extreme poverty and hunger. The link between EBA and the SDGs is twofold: on the other hand, the SDG targets were considered in the refinement of EBA’s indicators; on the other hand, specific data points from EBA may serve as metrics for tracking countries’ progress on SDG objectives (box 1.2).

**Conclusion**

EBA’s main objective is to measure and benchmark regulations that impact agribusiness globally. It can serve as a tool for countries to take stock of their current regulatory environment and promote change. Higher income and urbanized countries tend to have more agribusiness-friendly regulations, although there are numerous exceptions. Most countries have some good practices but EBA indicators also highlight areas that could be improved. A good way to start is through the introduction of regulations that promote quality control and nondiscrimination, efficient administrative procedures and access to information. EBA data demonstrate that all these objectives are compatible. The next chapters show how they can be achieved.
Figure 1.7 | OECD high-income countries on average have the most good practices related to access to regulatory information

Average number of good practices related to access to information

Source: EBA database.

Figure 1.8 | Use of water variability data to inform regulatory priorities

Normalized EBA water score

Normalized interannual variability

Sources: EBA database; FAO Aquastat/WRI 2016.

Note: Interannual variability is an indicator of the variation in water supply between years, created by the World Resources Institute (WRI). It ranges from 0–5, where 0 is lowest and 5 is highest (most variable). For plotting, both interannual variability values and EBA water scores have been normalized to a scale between −0.5 and 0.5.
EBA has links to a number of Sustainable Development Goals (SDGs), including Target 1.4 (Access to Basic Services), Target 2.5 (Genetic Diversity of Cultivated Plants), Target 6.3 (Improving Water Quality), Target 6.4 (Efficient and Sustainable Water Withdrawals), Target 6.5 (Integrated Water Resource Management), Target 9.3 (Enterprise Access to Financial Services) and Target 9c (Access to Information and Communications Technology), among others.

For example, SDG Target 2.5 calls to “maintain the genetic diversity of seeds, cultivated plants...and their related wild species, including through soundly managed and diversified seed and plant banks...and promote access to and fair and equitable sharing of benefits arising from the utilization of genetic resources.” EBA measures the existence of a national genebank or collection system for plant genetic resources, their data’s availability online as well as the access by private companies to the germplasm preserved in the gene banks (figure 1.2.1).

SDG Targets 6.4 and 6.5 call for efforts to “substantially increase water-use efficiency...and ensure sustainable withdrawals and supply of freshwater” as well as the implementation of “water resources management at all levels.” EBA measures the regulation of water use permits, the legal requirements and establishment in practice of basin institutions, basin plans, water resource inventories and water user registries. However, a big gap remains between the legal mandate and the implementation in practice in many countries (figure 1.2.2).

2 Seed
Tests completed in Uganda in 2015 revealed that seeds sold as hybrid maize in local markets were often not as advertised; less than half of the seeds were authentic hybrid seeds. High yielding seed must be made available to and ultimately adopted by farmers to increase their productivity and meet growing global food demand. However, inauthentic and poor quality hybrid seeds can result in smaller harvests, which ultimately affects farmer’s profitability. In Uganda, farmers make the decision to invest in hybrid seed expecting an improvement of their yield. This expectation justifies the higher price paid for these seeds compared to traditional varieties. If the expected yield is not met, farmers are likely to reject hybrid seed. To avoid such a scenario, in August 2016 the government of Uganda launched a campaign to reduce counterfeit seed in the market.

Seed is the most important input in crop production. In most countries, seed supply systems are dual, being characterized as informal (or farmer-managed) and formal. Informal systems are based on small-scale farmers’ own efforts to save seeds from their crops, and by farmer-to-farmer gifts, exchanges, and trade. Informal seed systems provide a rich diversity of seed, including varieties that are relevant to farmers and adapted to local weather conditions. They also offer dynamic channels of seed distribution that can reach the most remote farming communities. Finally, they are vital to support biodiversity and resilience against climate shocks. Formal seed systems were built on scientific breeding developed at the beginning of the 20th century by academic research and corporate breeding. Breeding associated with these systems led to an increase of yields, due to a considerable improvement of seed’s agricultural productivity, a greater resistance to insect pests and diseases, and tolerance to drought or flood. Formal seed systems generate new varieties that are then released for multiplication and distribution. Informal seed systems are also an important source of seed. Since farmers use both formal and informal channels to source their seeds in most regions, points of integration must be identified to achieve seed security in a balanced seed system that includes formal and informal players. The EBA seed indicators focus on the formal seed system due to the greater availability of comparable data. Formal seed systems are more uniform and are centralized around institutions. The activities performed across the system have been covered by treaties and other international standards. In contrast, informal seed systems are defined by the diversity of practices implemented across countries, or even across regions of the same country. Nevertheless, this year the EBA environmental sustainability topic piloted new indicators that measure innovative practices that support the circulation of seed produced by farmer-managed seed systems. This data, available on the EBA website (http://eba.worldbank.org), measure practices relevant outside of the formal seed system.
EBA is committed to developing indicators that support an integrated approach to strengthening seed systems and promote economic growth and poverty reduction. In line with this commitment, the seed indicators will be refined in future years to include practices tested this year in the environmental sustainability indicators, as well as expand the coverage of regulatory aspects relevant to the informal seed sector.

What do the seed indicators measure?

Seed indicators measure laws and regulations applicable to the development, release and quality control of seed, all of which are crucial to increasing the availability and quality of seed reaching the farmer (table 2.1). The seed indicators are organized as follows:

Plant breeding: The development of new varieties is essential to the strength of seed systems. Innovative breeding can increase plant resistance to climate change, lead to higher yields and stimulate an increase in private sector competitiveness. Among other factors, having a legal environment that grants intellectual property rights over plant materials is vital to encourage private sector investments in the seed sector. This indicator measures the existence of a regulatory framework granting and protecting breeder’s rights, the duration of the protections granted, the existence of discrimination between national and foreign breeders seeking protection, the availability of a list of protected varieties and the right to license protected varieties. In addition, the indicators cover access to materials essential for innovative breeding such as early generation seed developed by the public sector, germplasm stored in publicly managed genebanks, and genetic materials imported for research purposes.

Variety registration: The variety release process should ensure transparent rules for the release of hybrid seed of good quality and avoid unnecessary delays. This indicator measures how functional and inclusive the release process is, and the availability of information on new varieties. In particular, it covers the acceptance of testing data from foreign authorities, the composition of the variety release committee (VRC) and the existence and frequency of its meetings, and the availability and maintenance of an online variety catalogue. In addition, this indicator provides data on the time and cost involved for the private sector when registering a new maize variety with the government, from application to final release.

Seed quality control: The quality of seed is crucial for the adoption of new varieties by farmers. Only hybrid seeds of good quality can increase yields, ensure adaptability to climate change and therefore justify higher prices. The seed quality control indicator focuses on the quality control process that follows the release and multiplication of new varieties. It measures practices such as official fee schedules, the existence of a requirement to perform post-control tests, record-keeping to ensure traceability of breeding materials and labeling. Finally, this indicator measures the existence of third-party accreditation or self-accreditation to allow nonpublic sector actors to complement the government during the certification process.

How do countries perform on the seed indicators?

Overall, countries’ performances across indicators are varied. Among the three indicators under the seed topic, the plant breeding indicator has the most regulatory good practices adopted across countries. Plant variety protection laws and registries are in place in countries with the strongest and least burdensome seed regulations such as the Netherlands and Uruguay, as well as in others with weaker seed laws such as Burundi.

Table 2.1 | What do the seed indicators measure?

| PLANT BREEDING | • Existence, duration and terms of plant variety protection
|              | • Right to license protected varieties and availability of information on protected varieties
|              | • Access to germplasm, breeder and foundation seed
| VARIETY REGISTRATION | • Legal requirements to register a new seed variety and information accessibility, including time and cost
|              | • Acceptance of testing data from foreign authorities
|              | • Variety release committee and availability of online variety catalogue listing registered varieties
| SEED QUALITY CONTROL | • Breeders’ requirement to ensure the traceability of breeding materials
|              | • Publically available fee schedule for certification
|              | • Third-party accreditation or self-accreditation for certification activities
|              | • Labeling requirements and penalties for mislabeled seed containers

Sudan and Tajikistan (table 2.2). In Burundi, a 2016 decree introduced a legal framework for the protection of plant varieties and created a register of protected varieties administered by the National Office of Control and Certification of Seed. Nonetheless, there is still room for improvement, even in countries with a topic score above the global average such as Georgia, which has adopted most of the regulatory good practices of the plant breeding indicators and the seed topic in general, but does not yet have a list of protected varieties available publically.

Overall, OECD high-income countries perform the best in the EBA seed indicators. Most countries have inclusive release systems. But in Greece and Poland nongovernmental representatives are underrepresented in VRCs. In addition, seed producers applying for registration in these countries need to comply with additional procedures after the VRC’s decision to release the new variety. These additional steps affect the efficiency of their registration process, among the longest in the region. For most countries studied, additional efforts are required to have a strong and inclusive quality control process. It is less the case for OECD high-income countries, which have most of the regulatory good practices measured by the seed quality control indicator. Seed producers complying with mandatory certification have access to transparent costs and collaborate with the public authority to perform certain certification activities themselves. In Denmark, Italy and Spain, accredited seed companies perform their field inspections, sampling and lab testing and then label seed themselves. However, in Chile and Korea, plant breeders have not yet been required to retain records on the plant reproductive materials that they use.

Sub-Saharan African countries perform the lowest overall in the EBA seed indicators. Intellectual property rights are often neglected, as one-third of the countries in Sub-Saharan Africa do not grant any protection of plant materials or any access to germplasm conserved by public authorities. Regarding the region’s registration process efficiency, more than one-third of Sub-Saharan African countries studied are not registering any improved seed at all. The registration cost for a new maize variety in Sudan is among the highest across all countries studied, with an average cost representing 621% income per capita. Seed quality control processes lack transparency in the region since many countries do not have official fee schedules for certification activities that the government performs, and in nearly half of the countries, third-party certification is not permitted. Sub-Saharan African countries are closely followed by East Asian and Pacific and South Asian countries, whose performance on the seed indicators is also driven by a limited adoption of the regulatory good practices measured by the seed quality control indicator. However, several countries stand out within the Sub-Saharan Africa region with seed topic scores above the global average. In Kenya, for example, the legal framework provides tools for the protection of new varieties and access to early generation seeds and germplasms. The registration process is not restricted to the public sector and VRCs meet as often as necessary, which results in a registration time that is among the shortest across all countries studied. Furthermore, both Burundi and Rwanda adopted new legislation on the protection of plant varieties this year, which may lead to the creation of publically available registries.

What are the regulatory good practices?

Box 2.1 highlights regulatory good practices and some countries that implement these practices.

Allowing partnerships between the public and the private sector in the performance of seed-related activities

Scaling the formal seed sector is critical for countries wishing to increase the availability of hybrid seed of good quality.6 To do so, private sector participation must be encouraged. In many countries, public research takes the lead in areas such as pre-breeding, germplasm conservation, and crop and resource management. Therefore, it is essential that the private sector has access to the outcome of public research as well as to the genetic resources that the public sector conserves, to support their own breeding efforts.7 Seed companies can improve the production of breeder and foundation seed in the case of limited public capacity. Among the 62 countries studied, 38 allow private seed companies to produce breeder and foundation seed of local public varieties and to access germplasm conserved in public genebanks. For example, in Vietnam and Kenya, the law does not include any prohibition for the production of breeder and foundation seed, while in Guatemala, breeders wishing to produce them are required to sign an agreement with the Instituto

Source: EBA database.
de Ciencia y Tecnología (ICTA). In Benin, Burkina Faso, Cameroon, Lao PDR, Nicaragua and Peru, public research and genetic resources that the public sector conserves are not accessible to the private sector.

Partnership between the public and private sectors should not stop with breeding. The VRC is responsible for testing new varieties for registration and approving it for further commercial production and distribution. To ensure that testing criteria are developed by all stakeholders, nongovernmental representatives (associations of seed companies, nongovernmental organizations [NGOs] or farmer associations) should be included in the VRC routine operations. Among the 62 countries studied, 38 countries require the participation of nongovernmental representatives when deciding whether to release a new variety or not (figure 2.1). Among these countries, nine require an equal or higher number of nongovernmental representatives over governmental ones. In the Netherlands, for example, the largest seed producer in Europe and where there are more than twice as many nongovernmental representatives compared with public sector representatives in the VRC, the time to register a new variety is among the shortest across countries. In Denmark, the largest exporter of seed globally, only one of the 11 members of the VRC is a government representative. In contrast, Ethiopia, Mexico and Russian Federation, which do not have associations of seed companies, NGOs or farmer associations in their VRC, have among the longest registration time.

In many developing countries, the lack of personnel and other resources lead to long delays in seed certification and testing, which impede the delivery of certified seed to farmers in a timely manner. Laws can allow the accreditation of private laboratories, private inspectors and university centers to lessen the burden on the public sector. Among the 62 countries studied, 36 countries have laws that allows private seed companies and third parties to be accredited for certification activities usually performed by the national authority. In Romania, since 2002, individuals and seed companies can be accredited to carry out field inspection and sampling, to test seed quality and to issue certification documents under Ministry of Agriculture supervision. The accreditation is subject to training and to compliance with standards that the Ministry sets. In Cambodia, Nigeria and Sri Lanka, as well as in 16 other countries—mainly low-income and lower-middle-income countries—only the national authority can perform the mandatory certification.

Implementing regulatory good practices

The ideal regulatory environment for the seed sector is a clear legal framework supported by functioning institutions and efficient procedures. The law establishing institutions and granting rights should be enforced in practice. Similarly, practices implemented without a legal framework may not always be beneficial to all seed sector actors in the absence of clear implementation criteria. Among the 45 countries where public research institutes license public varieties to seed companies for production and sale, 13 countries do so in the absence of clear rules. In 2016, the Institute for Environment and National Research in Burkina Faso (INERA) designed a framework agreement on future public-private partnerships for the production of initial classes of seed.
The release process for a new variety is prescribed in the country’s seed law and usually involves an evaluation of the new variety through testing, review of the result by a decision body and registration in an official catalogue. Among the 62 countries studied, 56 establish a VRC tasked with reviewing the test results of any new maize variety, before its registration and release. In Benin, Bosnia and Herzegovina, Burkina Faso, Cambodia, Mali and Rwanda, the VRC provided for in the law does not appear to meet in practice, while they are a prerequisite to the availability of seed in countries where registration is mandatory. With the exception of few countries such as Georgia or Italy, where regulatory good practices go hand-in-hand with a streamlined and low-cost variety registration process, a large number of countries have adopted lengthy procedures that are likely to result in delays in seed delivery to the farmer.

Fourteen countries, most of them in Sub-Saharan Africa, do not have any private seed companies registering new maize varieties, despite appropriate regulations being in place. In Niger, the seed law establishes a strong regulatory framework, which includes a VRC with the participation of all stakeholders and meetings on a quarterly basis, as well as a variety catalogue available online. However, the country still has no private seed companies that register new maize varieties.

In a number of countries, VRCs are functioning with varied stakeholder participation and regular meetings but the registration process is still burdensome to seed producers because of its length or cost (figure 2.2). For example, in Nicaragua the registration regulatory requirements follow most of the good practices identified. The VRC is functional, meets monthly and does not require additional procedures to release the new variety after its decision. Despite these regulatory good practices, however, the variety registration process in Nicaragua is the third most expensive across all countries, equivalent to 787% income per capita, and has the sixth lengthiest procedure that lasts 650 calendar days.

Certification processes designed to ensure seed quality have been identified as having a negative effect and as impeding the development of the seed supply chain, due to delays in the government’s performance of certification activities. Accreditation mechanisms are intended to allow seed companies or third parties to assist the public authority in certifying seed. Among the 62 countries studied, more than half of them have created a legal framework for third party or self-accreditation. However, only 31 countries accredit individuals or companies for field inspections, sampling, lab testing or labelling. For example, in Armenia, Serbia and Uganda, seed companies or third parties have not been accredited despite the existence of regulation.

Ensuring seed quality in the market

Regulations establish mechanisms that guarantee farmers’ access to hybrid seed of quality for their crop production. Hybrid seeds, when used properly and together with other inputs like fertilizer, have proven to increase farmers’ yield by 12-15%. A registered seed’s genetic purity, identity and a given minimum quality level must be found in the seed sold if that seed is ultimately to reach the farmer’s fields and improve

Figure 2.2 | Few countries have both strong registration regulations and an efficient registration process
yields. Research has shown that farmers will not adopt new technologies such as improved seed varieties when they do not expect any economic return due to low-quality seed. Post-control tests assess the quality of certified seed to verify that the seed's varietal purity has been maintained. Among the 62 countries surveyed, half of them require the performance of these tests whether in the field or in laboratories. Among them, 10 countries have seed laws that require the national authority to test a minimum percentage of certified seed annually (Burundi, Denmark, Ghana, Greece, Morocco, the Netherlands, Poland, Romania, Spain, and Turkey).

Labelling standards and sanctions for the fraudulent sale of mislabeled seed containers can also improve seed quality at the retail level. A labelling system allows farmers to know what they are buying and from whom, making producers and distributors accountable for the seed container content. Standardized labels can improve farmer's confidence in the seed in circulation. Among 62 countries studied, 5 do not have a legal requirement to label seed containers for sale. Most of them require labels to include the producer name and address, the crop name, the class of seed and the minimum germination percentage, which is necessary for the farmer to make an informed decision on which variety to purchase. Other information such as the production year, the minimum purity percentage or the existence of a chemical treatment may also be required, such as in Ghana, Mexico or Zimbabwe. By contrast, more than half of the countries studied do not require labels to include information relating to repacking or relabeling of seed containers. Repacking and relabeling information allows the buyer to retrace certified seeds to their seed lots. Finally, a large majority of countries have seed laws that include a penalty for sale of mislabeled seed to discourage the circulation of fake seeds.

Conclusion

Introducing and implementing seed quality and assurance are challenging. This process requires a robust legislative framework, sufficient financial resources, well-trained inspectors, capable laboratories and relevant legal mandates to conduct post-control tests and market inspections. Countries that implement such systems take a significant step towards a more competitive and commercially-oriented agricultural sector that has access to improved varieties and increased crop yields. Moreover, such countries reduce the risk of fake and low-quality seed entering the market, which can otherwise undercut crop yields and lead to reduced food supply or even shortages.

3 Fertilizer
Fertilizer is credited with increasing global yields of food crops by 40–60%, and no region has been able to boost agricultural growth without increasing its use. The Green Revolution, which can be attributed to the use of fertilizers and improved seeds, has had a dramatic impact on the food supply and incomes of many developing countries. During the past 40 years the world witnessed an extraordinary period of crop productivity and was able to overcome chronic food deficits. However, the use of fertilizers and other chemical inputs has increased soil erosion and acidification and groundwater pollution. To counter this unwelcome development, care is necessary to prevent soil damage, environmental pollution or adulterated fertilizer use, while continuing to increase the much-needed use of fertilizer in certain regions.

Low productivity in regions such as Sub-Saharan Africa is associated with the limited adoption of fertilizer. In West Africa, for example, where soil nitrogen and phosphorus contents are low, fertilizer use between 2002 and 2009 was at an average of 5 kg/ha, significantly less than the recommended 50 kg/ha. While fertilizer use has dramatically increased in some countries such as Burkina Faso, from 0.4 kg/ha of arable land in 2002 to 14.3 in 2013, and in Ghana from 3.7 to 35.8 during the same time period, little change has occurred in other countries such as Niger, which has barely moved up from 0.6 to 0.7 kg/ha. Furthermore, low fertilizer use not only restricts yields today, but also promises future productivity declines due to the ongoing depletion of soil nutrients.

In Western Kenya most farmers grow maize, predominantly for subsistence. The average farmer plants just under one acre of maize during the “long rains” from March to July, and again during the less productive “short rains” from August until January. Using only one-half teaspoon of fertilizer per plant would increase yields by about $26 per acre and cost only $20 per acre. After accounting for the extra labor associated with fertilizer use, the fertilizer rate of return is around 70% a year, a worthwhile investment.

Fertilizer use in developing countries is constrained by a number of factors, particularly high prices and unavailability that often reflect unsatisfactory procurement practices, inefficient administrative procedures and inadequate infrastructure. Limited understanding among farmers of fertilizer use hampers more widespread fertilizer uptake. Some major challenges that impact farmers stem from the lack of new and innovative fertilizer products in the market, cumbersome import procedures that can discourage businesses from importing and adulterated or contaminated fertilizer products. Adulteration or contamination can lead smallholders to doubt the value and importance of fertilizers if their potency and effects are compromised. In more serious cases, fertilizer adulteration can reduce crop growth, affecting output in ways that lead to food and income insecurity and may be environmentally harmful.

Policies and regulations that enable the sector to grow and producers to maximize their potential, for example, can often come into conflict with concerns regarding soil health and water contamination. Nevertheless, strong regulations that enable increased fertilizer access are essential to increase yields. As a result, as in any other industry, the debate remains on appropriate regulation levels.

What do the fertilizer indicators measure?

The fertilizer indicators measure laws and regulations on the registration, import and quality control of fertilizer products, all of which are crucial to increasing fertilizer access (table 3.1). The indicators cover the following areas:

Registering Fertilizer: In most countries, fertilizer cannot be imported, manufactured, distributed, sold or used unless it has been registered with a designated authority. Registration of fertilizer products ensures the safe entry of new products into the market as governments are able to provide market oversight through a registration scheme and test the fertilizer’s impact on soil, human health and the environment. Moreover, product registration gives farmers confidence in the products that they are using. This indicator measures the following:

Registration requirements. The requirement to register fertilizer products, the types of entities required to register products, types of fertilizer products required to be registered and any time-limitations on fertilizer registration.

Registration procedures. Procedures, time and cost to register a new fertilizer product.

Fertilizer catalogue. The existence of an official fertilizer catalogue with a list of registered fertilizers, and its availability online.

Re-registration of fertilizer products. The requirement to re-register a product previously registered in another country.

Importing and Distributing Fertilizer: Fertilizer production is energy intensive, and the industry benefits from economies of scale as well as low costs of raw materials. It is no surprise, therefore, that the world’s production capacity is concentrated in a few countries. With just five countries producing half or more of the global supply of the most common types of fertilizer, simple and uncomplicated import procedures are essential to fertilizer access in the majority of countries around the world. This indicator focuses on:

Table 3.1 | What do the fertilizer indicators measure?

| Registering Fertilizer | • Legal requirements to register a new fertilizer product and information accessibility  
|                        | • Time and cost to register a fertilizer product |
| Importing and Distributing Fertilizer | • Entities allowed to import fertilizer products  
|                        | • Requirement for a company to register as a fertilizer importer  
|                        | • Requirement of import permits to import fertilizer products  
|                        | • Entities allowed to distribute fertilizer products |
| Quality Control of Fertilizer | • Labeling requirements for fertilizer bags

Source: EBA database.
Entities that are allowed to import and distribute fertilizer: Entities allowed to import and distribute fertilizer, including the private sector, nongovernmental organizations, and producers organizations.

Import registration: The requirement to register as a fertilizer importer and any time limits on the validity of the import registration.

Import permits: The need to obtain an import permit to import fertilizer products, any per-shipment or volume limitations applicable to the permit, any time limits on the validity of the permit and total time and cost to obtain the permit.

Quality Control of Fertilizer: The potential damage caused by adulterated fertilizer, typically not apparent until months after application, undermines trust in fertilizer quality and discourages farmers from using fertilizer at all.12 Quality control and inspection methods, as well as punishments for breaking laws, vary significantly across the world. However, a minimum set of standards to increase fertilizer quality control can be applied in all countries and across regions and income groups. This indicator measures:

Labelling and packaging requirements: The obligation to label fertilizer bags and specific labeling requirements, including language and label content.

Mislabeled and open-bag fertilizer: The prohibition of and establishment of penalties against the sale of mislabeled and open-bag fertilizer.

How do countries perform on the fertilizer indicators?

Bosnia and Herzegovina performs the best on the fertilizer indicators this year, due to strong regulations in all areas; it has one of the most inexpensive and least burdensome fertilizer registration procedures, and registration also does not expire and is not subject to periodic fees. In addition, all registered fertilizer products are included in a catalogue that is accessible online, creating further transparency for industry stakeholders. Bosnia and Herzegovina performs particularly well on the importing and distributing fertilizer indicator; for example, importer registration is a one-time-only requirement and no per-shipment import permits apply. On quality control measures, fertilizer bags must comply with comprehensive labeling requirements in at least one of the country’s official languages, and mislabeled and open bags are prohibited and subject to penalties, encouraging further fertilizer quality control. EU countries also performed well across all fertilizer indicators, with Denmark, Greece, Italy, Poland and Spain all receiving among the top 10 scores, principally due to strong rules adopted and harmonized at the EU-level.13 OECD high-income and Europe and Central Asia countries demonstrate strong regulations applicable to importing and distributing fertilizer—high-performing countries typically only require a one-time import registration at the company level and do not require any per-shipment import permits.

The countries, from lowest to highest, with the worst performance on the fertilizer indicators include Liberia, Benin, Senegal, Ethiopia, Haiti, Sudan, and Burkina Faso, along with Niger. These countries have rudimentary regulatory frameworks for registering fertilizer. Countries that performed poorly with respect to regulations for importing and distributing fertilizer are primarily located in Sub-Saharan Africa and the Middle East and North Africa regions, where the renewal period for importer registrations are shorter and import permits are expensive and valid for a shorter period of time. Ethiopia received the lowest score of all 62 countries on importing and distributing fertilizer because the private sector is prohibited from engaging in any such activities. The lowest scores in the quality control indicator, also found predominantly in the Sub-Saharan Africa region, are driven by the absence of laws prohibiting mislabeled and open-bag fertilizer, the lack of appropriate penalties and the absence of labeling requirements in at least one of the official languages of the country (table 3.2).

Significant variation was found across countries with respect to the efficiency and complexity in registering fertilizer products. The time and cost to register a new fertilizer product are lowest on average in OECD high-income and upper-middle-income countries, and highest in low-income countries (figure 3.1). For example, it takes on average 330.7 calendar days to register...
a fertilizer product in the 62 countries sampled, ranging from 1205 days in Romania to 11 days in Uruguay. This stark difference in time is driven principally by lengthy field testing. Across the 62 countries sampled, the average cost to register a new fertilizer product is 171.7% of income per capita, and it is most expensive in Malawi, totaling 3030.5% of income per capita. It is cheapest in Spain where it is free.

What are the regulatory good practices?

Box 3.1 highlights regulatory good practices and some countries that implement these practices.

Reduced field testing for fertilizer registration

Registering new fertilizer products is a good practice because it ensures that a country has control over what fertilizers are used within its borders. Registration schemes and the oversight they provide are helpful in giving farmers assurance that inadequate nutrients, heavy metals or other residues found in fertilizer products do not contaminate crops, animals and the environment. However, registration procedures should be time and cost efficient to ensure that new products can reach the market in a timely manner. Although controls are necessary to prevent soil damage, environmental pollution or adulterated fertilizer use, certain lengthy

Source: EBA database.

and expensive procedures such as field testing are not deemed necessary as part of an effective registration process. Three complimentary nutrients (nitrogen, phosphorus, and potash) have been extensively tested and used for over a century, with general agreement on the required balance that will maximize production. Practitioners report that a simple soil analysis can be used to determine if the product is suitable for that agro-ecological zone, and there is general consensus on which fertilizer to use for particular crops. As a result, field tests for these ingredients only drive up the time and cost of fertilizer registration, with little added value (figure 3.2).

Of the 48 countries that actually practice fertilizer product registration, 21 require field testing, the majority of which are in Sub-Saharan Africa (7), South Asia (4), and Europe and Central Asia (6). In countries requiring this procedure, the average cost in income per capita is 319% (63% if outliers Malawi, Nepal, Tanzania and Ukraine are excluded), compared to 16% in countries that do not require field testing. The average time to register a new fertilizer product in countries requiring field testing is 536.35 days, in contrast to 125.1 days in countries where this requirement does not exist.

Streamlined import permit requirements

Among the 62 countries studied, 22 countries do not impose any import permit requirements, nine of which are in Europe and Central Asia, and six are OECD high-income countries. Several countries in Sub-Saharan Africa (Cameroon, Côte d’Ivoire and Kenya) and in Latin America and the Caribbean (Haiti and Peru) do not require an import permit and can serve as good examples for other countries.
In 20 of the 39 countries that require import permits, those permits are valid for less than 12 months. If an import permit is required, the least burdensome option are blank permits with no volume, shipment or time limits that are affordable and simple to obtain. Blank permits with time validities of 12 months or more grant importers flexibility in terms of the departure and arrival time of shipments, and allow companies’ decisions with respect to the volumes and prices to be based on commercial interests. Twelve countries impose blank permits with no volume restrictions, the majority of which are in Sub-Saharan Africa (5) and the Middle East and North Africa (3). The majority of these countries have a permit validity of more than 12 months.

Per-shipment import permits with short time validities pose several problems. First of all, they limit the importer’s negotiating power, as the import permit is attached to a specific shipment (and therefore volume) that cannot be changed once the permit is issued. Furthermore, short time validities force companies to negotiate purchases within very specific time periods and, in some instances, they also present logistical complications, such as the permit expiring before the fertilizer is shipped from one place to another.

Twenty-three countries still impose per-shipment import permits, and four countries impose permits by volume. Burundi and Sudan require a per-shipment import permit with a two-month validity, whereas Bolivia, Nicaragua, Tanzania and Vietnam require a per-shipment import permit that expires within a month. Bangladesh and Nigeria impose a different kind of restriction by requiring per-shipment import permits with a particular volume quota that is valid for 12 months. Not all 23 countries impose such limited time frames—Senegal requires a blank permit that is valid for 48 months and Benin’s blank permit is valid for 24 months.

Closing the gap between fertilizer registration law and practice

Of the 62 countries studied, 48 legally require fertilizer products to be registered before they can be imported and sold in the country. Some countries, such as those in the EU, perform well on the fertilizer registration indicator because they have strong legal frameworks in place and there is a low-cost process to register fertilizer products that is streamlined and efficient. However, many other countries lag behind despite a strong legal framework, either because businesses do not register fertilizer products in practice or because the registration process is so onerous as to discourage the registration of new fertilizer products altogether.16

Six countries either have no observable practice in terms of the registration of fertilizer products or only allow the public sector to register fertilizer products. In Burundi, Mozambique and Tajikistan, although the private sector is permitted to register new fertilizer products, no products were registered last year. In
Bolivia, Ethiopia and Kenya, the law permits only the public sector to register new fertilizer products.

Several other countries have strong legal frameworks in place for registration but use complicated registration processes, including the total time (in calendar days) and cost (as a percentage of income per capita) to register a new fertilizer product (figure 3.3). For example, although Malawi’s regulatory framework performs above average as compared with other countries, the practical experience for private sector actors registering fertilizer products in the country results in it receiving one of the lowest ratings on this component. Malawi follows regulatory good practices such as requiring fertilizer product registration and having no time limitation to the fertilizer product registration. However, Malawi has the fourth lengthiest and the most expensive fertilizer registration process out of all 62 countries, taking 913 days and 3030.48% of income per capita to register. Similarly, while Nepal’s registration laws also perform above average, their practical application is relatively lengthy and costly; it takes 1,125 days, and 645.2% of income per capita to register a new fertilizer product in Nepal.

**Conclusion**

There are many opportunities for countries to implement laws and regulations that improve access to fertilizer, promote fertilizer use, and increase agricultural productivity. Regulatory best practices may be difficult to achieve in certain regions in the short term due to a mix of factors, including the absence of laws and lack of institutional capacity for implementation. However, certain practices can facilitate regulatory and market efficiency and thus increase fertilizer access. While fertilizer registration ensures the safe entry of fertilizer products into the market, efforts should be made to make the process as efficient as possible, while maintaining quality control. Ensuring that fertilizer registration is not held up by procedures such as field testing, which has been deemed unnecessary in most cases, can go a long way in cutting time and cost and encouraging the entry of new fertilizer products into a market. Furthermore, streamlining import permits can facilitate timely fertilizer entry into a country and help avoid time-consuming paperwork and logistical complications.
NOTES

Machinery
Each year during plowing season, Leela Rajput used to hire 15 laborers to work from dawn until dusk every week preparing his 10-hectare plot in the northwestern Indian state of Uttar Pradesh. This year, he will use a tractor instead. With the machine, he expects to finish the job in a single day. Indian agriculture is belatedly engaged in a mechanical revolution, boosting productivity in a sector that has long relied on cheap labor to tend crops in the world’s second most populous country. Job opportunities in cities have drained the pool of workers in villages. “I just can’t find enough people to do the hard work in the fields anymore,” says Mr. Rajput. He adds that the tractor helps bring more women into the workforce by making the work less physically demanding.¹

Farm machines are indispensable to modern agriculture. Some of the most significant increases in farming productivity have been achieved as a direct result of agricultural machines.² Agricultural mechanization offers the ability to increase agricultural productivity by bringing more land under cultivation and by improving the timeliness of operations, thereby enabling markets for rural economic growth and improving rural livelihoods.³ By enhancing the efficient utilization of inputs such as seeds, fertilizers, plant protection chemicals and irrigation water, and expanding cultivated areas, agricultural mechanization can greatly enhance farming profitability and reduce human drudgery. This change can make farming a more viable and attractive commercial enterprise, particularly for youth, and promote rural employment. Furthermore, the benefits of agricultural machinery become particularly important as the demand for food, fiber and fuel continues to rise against a backdrop of expanding urbanization and increased constraints on land and water resources.⁴

Despite its benefits, mechanization levels still vary widely across the globe. In the countries studied for EBA 2017, high mechanization levels are observed in European countries, with penetration rates of 1,300 tractors per 100 square kilometers of arable land, as in the case of Poland.⁵ By contrast, low mechanization levels persist in many developing countries, particularly in Sub-Saharan Africa, with penetration rates as low as 2.24 tractors per 100 square kilometers of arable land, as in the case of Mali. In many regions, mechanization’s low contribution to agricultural development is partly due to the fragmented policy approaches taken by governments on mechanization issues.⁶ Despite its high cost and high profile, agricultural machinery is an input like any other and the policies, laws and regulations impacting the industry affect the way in which mechanization inputs are made available on the market, including their accessibility, commercial viability and safety. For example, most countries today leave the importation and sale of tractors to the private sector. However, the public sector continues to be involved in matters related to licensing, inspection and testing, and other areas of regulation regarded as being in the public interest.
What do the machinery indicators measure?

Agricultural tractors are used as a proxy to measure laws and regulations that may restrict tractor imports and operations, as well as the quality requirements applicable to imported tractors (table 4.1). Agricultural tractors were chosen for their relevance and comparability, given that tractors are imported and used around the globe, unlike other forms of machinery that are region or crop specific. The machinery indicators are organized as follows:

**Tractor imports**: This indicator measures aspects related to importing agricultural tractors, including the ability of private sector companies to import and sell tractors, and the procedures for registering as a tractor importer and for obtaining an import permit. Few developing countries manufacture agricultural equipment and machinery domestically. As a result, demand must be met through imports, typically handled by the private sector though sometimes managed through government imports. Even where the private sector is involved, however, tractor importation procedures can be cumbersome and time consuming for businesses, due to unnecessary or inefficient bureaucracy. This inefficiency negatively impacts the process and increases transaction costs and delivery times. An efficient and inexpensive process can greatly ease supply constraints for tractor importers and improve tractor distribution in a country.

**Tractor operations**: This indicator measures the legal and practical dimensions of registering agricultural tractors and completing inspections of in-use tractors, as well as the requirement that tractor dealers provide after-market tractor service and parts. Registering agricultural tractors not only establishes ownership rights over the purchased tractor but it also facilitates the enforcement of road, safety and tax regulations. Furthermore, a substantial proportion of the tractor fleet in many countries is not safe for operation due to poor maintenance and a lack of repairs. Therefore, most countries require that tractors be inspected at regular intervals to identify faults and conduct repairs, which can, in turn, improve tractor performance. Agricultural tractors can have a life span of 5 to 30 years, but they can be kept operational only through regular servicing. Therefore, it is essential that farmers have access to tractor service and maintenance, and spare parts. A regulatory framework that promotes efficiency and reduces transaction costs for tractor registration and roadworthiness checks, while at the same time ensuring control and safety, can enhance the uptake of machinery and protect tractor users.

**Tractor testing and standards**: This indicator measures the legal and practical dimensions of tractor testing, the prevailing tractor type approval process in a country (including the associated procedures, time and costs) as well as tractor performance and operator safety standards. Standardization and tractor testing systems alone cannot boost mechanization growth. However, appropriate testing and streamlined type approval procedures for agricultural tractors undertaken in conformity with established national or international standards can increase the safety and technical reliability of tractors, reduce the environmental and social cost inflicted by substandard tractors, and increase farmers’ access to safe, reliable and efficient machinery. While the absence of testing and standards may help encourage growth in agricultural mechanization in the short-term, it risks problems emerging in the future. Therefore, a thorough testing and evaluation of a tractor’s performance, its quality, durability and safety, should be required.

How do countries perform on the machinery indicators?

The countries that score high on the machinery indicators tend to have higher tractor penetration rates (figure 4.1). Certainly, there are several factors—such as specific mechanization policies and market realities—that affect the agricultural machinery sector and contribute to the adoption of tractors for agricultural production. However, the enabling regulatory environment for agricultural machinery and the efficiency with which governments are implementing laws and regulations are important precursors for a well-functioning tractor market.

Countries with the highest score on the machinery topic, such as Poland, Romania, Serbia and Turkey, share many common features (table 4.2). These countries facilitate streamlined import procedures, making it easy for tractor importers to introduce their products to the market, while at the same time promoting adequate control and inspections to ensure that tractors meet quality, durability and safety standards. The countries with the lowest scores, such as Liberia, Mali and Myanmar, each demonstrate room to adopt many of the identified good practices. For example, importing tractors is cumbersome in these countries and standards with regards to quality, performance and safety are not established or followed. Regulations on tractor registration, type approval, roadworthiness inspection and tractor maintenance provision are weak or absent in these countries.

The quality of regulations and practices in the tractor operations and the tractor testing and standards indicators vary greatly across countries. The three countries within the Middle East and North Africa region (Egypt, Jordan and Morocco) and most OECD high-income countries covered have robust regulations on tractor operation that require tractors to be registered and inspected for roadworthiness. Most of these countries also make the provision of after-market parts and services a statutory requirement, ensuring road safety and security to customers. OECD high-income countries and countries in the Europe and Central Asia region score highest on tractor testing and standards,

as most of them require tractors to be tested and type approved, while at the same time mutually recognizing the certifications issued by other countries. By contrast, countries in the Latin America and Caribbean region score low in this indicator because regulations on tractor testing, as well as tractor performance and safety standards, are not established.

Although the scores on tractor imports do not vary as much across countries as for tractor operation and tractor testing and standards, differences do exist. The 8 OECD high-income countries and the 11 countries in Europe and Central Asia region have implemented all the good practices identified under the tractor imports indicator. For example, these countries do not require importers to register in addition to the general business license, and import permits are not required in these regions. By comparison, countries in Middle East and North Africa and Sub-Saharan Africa regions have lower tractor imports indicator scores.

The data show that countries that score higher on tractor imports and operations also tend to have stronger laws on tractor testing and standards. Scores also indicate that regulatory efficiency on the one hand—as defined by the time and cost involved in complying with target regulations—and tractor quality control regulations on the other, tend to be complements rather than substitutes. Countries with a strong legal framework also often have less burdensome procedures in terms of time and cost associated with tractor registration and tractor type approval (figure 4.2).

What are the regulatory good practices?

Box 4.1 highlights regulatory good practices and some countries that implement these practices.

Safeguard availability and timely delivery of agricultural tractors through streamlined import procedures

Complex import formalities impede the flow of international trade and increase the time and cost to import. Nevertheless, many countries continue to require permits as a prior condition for the importation of tractors. Where permits do exist, the application process should be as efficient and cost-effective as possible, the validity should be unlimited and there should be no restrictions in terms of quantity of tractors or number of shipments.

Among the 62 countries studied, 17 require importers to obtain permits to import tractors. Sometimes, import permits are intended to provide assurance on the shipment quality or to limit the quantity of imports to protect local manufacturing. None of the OECD high-income and Europe and Central Asian countries—many of them manufacturers of tractors—require import permits. Among the 17 countries where import permits are required, only Bangladesh, Cameroon, Côte d’Ivoire, Ethiopia and the Philippines allow permits with no restrictions in terms of quantity or number of shipments, and the permits have a validity of 12 months. By comparison, Lao PDR and Myanmar require that importers apply for a permit for each tractor shipment and the permit validity is only three months, making it comparatively burdensome for tractor importers to introduce their products to the market.

The data also shows that many countries—almost all of them low-income or lower-middle-income countries—require private companies to register as tractor importers in addition to the general business license. Countries may have introduced this requirement to monitor trade flows and the quality of imported goods, but the process should be efficient and affordable to limit its impact on trade flows. In half of the countries where this procedure is required, the registration is indefinite and does not have to be repeated. But in 14 countries, the registration has to be renewed after a number of years or after half a year, as in the case of Colombia. While the registration renewal is automatic in four countries, tractor importers in six Sub-Saharan countries, and in Bangladesh, Colombia, Myanmar and Sri Lanka have to undergo the entire process of registration renewal each time.

The correlation between the machinery legal and efficiency scores is 0.62. The correlation is significant at the 1% level after controlling for income per capita.
Facilitate tractor durability by requiring roadworthiness inspections and tractor after-market service and parts

Most countries require vehicles to be maintained in safe, roadworthy condition for them to be used on their roads. Given that agricultural tractors are increasingly used to replace trucks in local transport activities and for commercial road haulage purposes, tractors in many countries are subject to roadworthiness inspections at regular intervals. The tests are conducted at an authorized test center and typically include testing of the brake and steering systems, vision features, noise pollution and other features. Of the 62 countries studied, about half make regular tractor roadworthiness testing mandatory. The data show that none of the countries in the Latin America and Caribbean region require inspections, with the exception of Chile and Haiti, while all four countries do in South Asia (Bangladesh, India, Nepal and Sri Lanka). European Union countries still have different requirements with regards to roadworthiness inspections of tractors. As of May 2018, however, the European Union will be harmonizing the minimum requirements for mandatory periodic roadworthiness tests for tractors with a maximum design speed exceeding 40km/h used for haulage on public roads.

Among those countries that require roadworthiness inspections, the period between required tests varies...
greatly. For example, in Burkina Faso, Malaysia and Uganda, the test is required every half-year. By contrast, in India the test is done only every five years. Experts suggest, however, that inspections should occur every two years. Only five countries—Poland, Romania, Spain, Turkey and Zimbabwe—take this approach. The cost of inspections also varies across countries, ranging from 0.2% income per capita in OECD high-income countries, to 6.5% income per capita in Sub-Saharan African countries.

Countries that mandate roadworthiness inspections should logically also ensure that farmers have access to appropriate repair services and spare parts. All too often, tractor operators do not have any support if a machine breakdown occurs, and tractor “graveyards” can still be found in many countries. Tractor dealers are not legally required to provide tractor maintenance and repair in the majority of countries studied for EBA 2017, with the exception of OECD high-income countries or those located in the Middle East and North Africa region.

Guarantee high-quality tractors by requiring type approval and testing of tractors in conformity with established standards

Agricultural tractors are imported from various countries. Although tractors are designed to satisfy a range of conditions, a machine produced in one country may or may not suit another country because of the prevailing edaphoclimatic conditions. The tractor design and construction alone are not sufficient to judge and select a machine designed for a certain operation. As such, a thorough testing and evaluation should be required of the tractor performance, quality, durability and safety.

Tractor tests are typically undertaken in conformity with established national or international standards. Tractor performance and tractor operator safety standards ensure that only high-quality machines enter a country’s supply chain and they provide unbiased information to manufacturers and consumers of tractors. Among the 62 countries studied, it is mostly countries in the Europe and Central Asia region and OECD high-income countries that have established national performance and safety standards or that enforce international tractor standards.

Tractor type approval is mandatory in about half the sample countries. All OECD high-income countries (with the exception of Chile) and European and Central Asian countries (with the exception of Georgia) have this requirement, along with India, Morocco, the Philippines, Vietnam and 10 countries in Sub-Saharan Africa. It should be noted that while the type approval is legally mandated in these countries, there appears to have been no such practice in Armenia, Kyrgyz Republic and Tajikistan.

The procedures involved in tractor type approval vary across countries, and the associated time and cost are consistently higher in countries where multiple
procedures are required (figure 4.3). While it is important that governments implement regulations in a time- and cost-efficient manner, a minimum number of steps should be involved to thoroughly test and evaluate a tractor and its performance. Tests should include laboratory testing and the issuance and publication of a test report. Many countries also test the tractor in the field, a procedure that is practiced in all OECD high-income countries (with the exception of Chile, where type approval is not required), as well as in Cameroon, India, Kazakhstan, Malawi, Nigeria, the Philippines, Romania, Russian Federation, Serbia, Sudan, Turkey and Ukraine.

Testing of agricultural tractors ensures the quality of tractors and their suitability for country conditions. Nonetheless, some of the main challenges traders face are costly and lengthy testing or certification of tractors, often duplicated across countries. Valuable business time and money could be saved if a tractor could be tested once and the results accepted in other markets for the tractor to be type approved. The mutual recognition of conformity assessment results is strongly encouraged by the World Trade Organization (WTO) Agreement on Technical Barriers to Trade and is already operational in a number of existing networks in Europe and Asia and Pacific with regards to machinery testing. Such a model could be applied in Africa.

The 22 countries in which tractor type approval is required—most of them OECD high-income countries and countries in Europe and Central Asia, but also in Cameroon, Côte d’Ivoire, Ethiopia, Morocco, Uganda and Zimbabwe—recognize type approval certifications issued in other countries. In the European Union, a tractor that is tested by a designated testing facility and type approved by an authority in a member country is automatically recognized and accepted in other member countries without the need for further testing. The approval has unlimited validity and renewed testing is not required, provided that the specifications of the tractors are the same.

As outlined above, multiple testing or certification of agricultural tractors represents a burdensome endeavor for companies in many countries. In Kazakhstan, Kyrgyz Republic, the Philippines, Russian Federation and Ukraine, the tractor type approval process has to be repeated after five years and in India after three years.

**Conclusion**

An agricultural machinery procedural framework that balances control and efficiency requirements can help facilitate and ease the availability of tractors for agricultural production. Countries such as Poland, Serbia and Romania demonstrate that regulatory efficiency on the one hand—as defined by the time and cost involved in complying with target regulations—and tractor quality control regulations on the other, tend to be complementary and are important precursors for a well-functioning tractor market.

9 Type approval (or “homologation”) is the official recognition given by a national authority or agency that certifies that the tractor conforms to the prevailing regulatory, technical and safety requirements in the country. Before the tractor can be sold on the market and before reaching the farmer, the manufacturer (or an agency on behalf of the manufacturer) must complete its type approval and be certified by third-party verification that its design, construction and performance respect the country’s regulations and standards.

Finance
GADCO, a major rice processor in West Africa, buys rice from thousands of smallholder farmers. In the past, farmers had to travel, sometimes long distances, to the GADCO offices to receive payment in cash. However, in 2013, GADCO partnered with Tigo, a leading mobile operator in the region, to compensate farmers via mobile payments. Today farmers benefit from the convenience of accessing their money via agents who are available 24 hours a day, rather than waiting in line at a bank, and from the simplicity of buying mobile airtime directly with their Tigo-Cash virtual wallet, rather than having to buy and load airtime from a scratch card. Furthermore, because GADCO distributes monthly account statements, the program improves farmers’ ability to monitor their accounts.

Finance is a key element of agricultural development. Farmers require working capital, seasonal loans, and medium- to long-term credit to finance production, harvest, storage, transport and marketing. In addition to loans, farmers need access to payment services to expand operations. In this regard, reduction of rural poverty and increases of total per capita output can be achieved through enhancements in rural credit. However, rural and agricultural finance are among the most challenging fields of financing. Agricultural production activities are seasonal, weather-dependent and spatially dispersed, making agricultural loans riskier and costlier than loans for business activities operated in urban locations. Formal financial institutions, especially commercial banks, have limited reach in rural areas. Furthermore, farmers often have difficulty obtaining loans due to inadequate collateral. In developing countries, 78% of the capital stock of business is in the form of movable assets such as machinery, equipment or receivables, yet most financial institutions do not consider these assets as good sources of collateral.

Innovation in the design and provision of financial services improves access to finance. Regulations need to be adapted to allow financial institutions, mobile operators and retailers to explore new services and partnership models, while protecting the integrity of transactions and the safety of customers’ deposits. Therefore, a strong legal framework is necessary to increase access to financial services. Laws and regulations should also provide farmers with the ability to use movable collateral to obtain a loan, while protecting lenders.
What do the EBA finance indicators measure?

EBA finance indicators measure laws and regulations that affect access to financial services for farmers and agribusinesses (table 5.1).

The indicators are organized as follows:

**Non-bank lending institutions:** This indicator measures the regulatory framework for deposit-taking microfinance institutions (MFIs) and financial cooperatives. MFIs and financial cooperatives are important providers of financial services to agribusinesses and farmers, especially those that cannot access financial services through commercial banks.6

**Operation and prudential regulation of MFIs.** This sub-indicator measures the requirements to establish an MFI and prudential regulations including minimum capital adequacy ratios and provisioning rules, as well as consumer protection requirements focusing on interest rate disclosure and enrollment in a deposit insurance system.

**Operation and governance of financial cooperatives.** This sub-indicator focuses on the regulatory framework for financial cooperatives including the minimum requirements for their establishment, prudential ratios, the ability to merge and consumer protection requirements similar to those measured for MFIs.

**Branchless banking:** Branchless banking, which consists of agent banking and e-money, can play an important role in providing financial services to clients who are traditionally excluded from formal financial services.7 Strong regulations on branchless banking protect against the loss of customer funds,8 fostering a positive customer experience that creates trust in the system.

**Agent banking.** This sub-indicator focuses on the regulations that allow third-party agents to provide financial services on behalf of financial institutions. It covers the minimum standards to qualify and operate as an agent, exclusivity of agent contracts, the range of financial services agents can provide and financial institution’s liability for agent actions.

E-money. This sub-indicator covers the regulations for the provision of e-money by non-financial institution issuers. It covers licensing and operational standards, as well as requirements on safeguarding customer funds and deposit insurance protection.

Movable collateral: The movable collateral indicator focuses on provisions relating to the use of collateral categories that are relevant to agricultural enterprises and smallholders. A warehouse receipts system creates the possibility for using agricultural products (such as crops) as collateral—farmers deposit products in a licensed warehouse in exchange for a warehouse receipt, which they can use to obtain a bank loan.

Warehouse receipts. This sub-indicator measures specific legal provisions governing the use of warehouse receipts as movable collateral. It covers the elements of a valid warehouse receipt, performance guarantees and receipt negotiability.

Legal rights and credit information. This sub-indicator takes some of the measures of legal rights of borrowers and lenders with respect to secured transactions and depth of credit information from the Doing Business–Getting Credit topic. It covers regulation on movable collateral, security rights on future and after-acquired assets, and the depth of credit information on small loans and availability of credit information from non-bank institutions.

How do countries perform on the finance indicators?

Countries from OECD high-income and the Latin America and the Caribbean regions perform the best on the finance topic, driven largely by the strength of regulations on MFIs and financial cooperatives, and a regulatory environment that enables branchless banking. Most OECD high-income countries have established a comprehensive regulatory environment for financial cooperatives and regulations that enable branchless banking, mainly for e-money. Meanwhile the Europe and Central Asia region earned the second highest score on the movable collateral indicator including the Doing Business–Getting Credit indicator and regulation of warehouse receipts. Although low-income countries score poorly on average, Tanzania emerged as one of the top five performers in the finance indicators (table 5.2). Tanzania earned high scores for its regulations on MFIs and financial cooperatives, as well as its warehouse receipt regulations, which describe the elements of a valid receipt and require the warehouse operator to provide multiple performance guarantees.

At the indicator level, countries’ scores on non-bank lending institutions, branchless banking and movable collateral indicators do not correlate significantly among themselves, suggesting that countries rarely score universally well on the indicators. For instance, Uganda has comprehensive legislations regulating the operation of warehouse receipts, but it lacks a regulatory framework for agent banking activities and does not allow non-financial institutions to issue e-money.

Between March 2015 and June 2016, a total of 16 countries conducted regulatory reforms to align with certain good practices (box 5.1) in areas that are measured by the finance indicators. E-money was the area with the highest number of reforms: nine countries in Sub-Saharan Africa (SSA) (Ghana, Tanzania, West African Monetary Union [WAMU] members, and Zambia), and Myanmar reformed their e-money laws. Other reforms in the past year include Côte d’Ivoire, which adopted a new law regulating warehouse receipts; Ghana and Mozambique adopted new legal frameworks for agent banking; and Myanmar adopted a new banking regulation.

In addition to enacting legislative reforms and regulations to enable agriculture financing, countries also explored other policy measures such as state-sponsored Partial Credit Guarantees Schemes (PCGSs) and mandatory lending quotas to promote agricultural finance. There is strong evidence suggesting that the simple existence of a PCGS does not guarantee increased lending to the agriculture sector and that lending quotas for agriculture lead to low profitability for banks and high non-performing loans. As country context and implementation details significantly affect the results of such policies, EBA did not score this data. Data collected show that 18 of the 62 countries studied have a PCGS specialized for agricultural loans lent by commercial banks. The SSA region has the highest number of countries (6 of 21) with PCGSs, followed by Latin America and the Caribbean (4). Only eight countries, mostly in SSA, allow MFIs to participate in the scheme. For lending quotas, only seven countries have policies requiring commercial banks to

lend a percentage of their portfolio for the purposes of promoting agricultural activities—namely, Bangladesh, Bolivia, India, Nepal, the Philippines, Sri Lanka and Zimbabwe. Bolivia is the only country that also requires MFIs to lend a percentage of total loans to the agricultural sector.

What are the regulatory good practices?

Box 5.1 highlights regulatory good practices and some countries that implement these practices.

Adopting a tiered approach for regulating deposit-taking financial institutions

The non-bank lending institution indicator measures consumer protection and prudential regulation for deposit-taking MFIs and financial cooperatives. Countries with a strong legal framework for deposit-taking MFIs in particular tend to have a higher share of the adult population that borrows to start, operate or expand a farm or business, or received payment related to agribusiness products (figure 5.1). This situation suggests that strengthening the legal framework for deposit-taking MFIs has great potential for enabling agribusiness activities.

In establishing a regulatory framework for deposit-taking institutions, it is a good practice to adopt a tiered approach that corresponds with the financial institution’s risk portfolio. Prudential regulation such as capital requirements, capital adequacy ratio (CAR) and loan loss provisioning are important components of a legal framework that limits risk-taking of deposit-taking institutions. These regulations are risk management tools that ensure that financial institutions are well-capitalized in the event of a financial shock. Given their tendency to have riskier portfolios and higher operating costs, a good practice for regulating deposit-taking MFIs is to establish capital adequacy requirements and provisioning rules that are equal to or slightly more aggressive than those of commercial banks. Among the 33 countries with a legal framework for deposit-taking MFIs, nearly 90% include capital adequacy requirements for MFIs. In contrast, countries have adopted diverse risk management practices for regulating financial cooperatives. While 26 out of the 56 countries with a legal framework for financial cooperatives have established minimum capital adequacy requirements for financial cooperatives, the remaining 30 have adopted various other risk management practices, such as establishing a minimum liquidity requirement or a maximum credit exposure.

Increasing consumer protection through deposit-insurance scheme and transparency in pricing

Financial consumer protection ensures that customers receive clear information on products and services to allow them to make informed decisions, and increases trust in the banking system. Regulations can help improve consumer understanding of terms and products and increase market competition by requiring financial institutions to disclose the effective interest or full cost of credit to the customer. While 76% of countries studied require commercial banks to disclose the full cost of

Sources: EBA database; Findex database.

Note: Countries with a strong legal framework for deposit-taking microfinance institutions (MFIs) are those that have a score standing in the first quartile of the MFI scores. Countries classified with a high level of financial inclusion are not measured under the MFI and agent banking indicators. Countries that score 0.8 or higher, as measured by the average of the normalized value of the Findex variables “account at a financial institution (% of rural adult population)” and “account at a financial institution (% of adult population),” are classified as having a high degree of financial inclusion. Countries under this classification are as follows: Denmark, Greece, Italy, Korea, Rep., the Netherlands and Spain. Lao PDR, Liberia, Morocco and Mozambique are not included in the sample as data are missing from the Findex database.
credit to customers, only 39% require MFIs to disclose this information (42% for financial cooperatives). These requirements are either embedded in the legal framework regulating the specific financial institution or can be found in the general consumer protection laws.

In addition, although a majority of countries (69%) require traditional banks to participate in a deposit insurance scheme, only 14 countries also require MFIs and only 11 countries require financial cooperatives to participate in a deposit insurance system. Mexico is one of the countries that scores highest on the non-bank lending institutions indicator and it requires both MFIs and financial cooperatives to participate in a deposit insurance system.

### Diversity of financial service providers in branchless banking operations

Strengthening regulation on branchless banking operations such as e-money and agent banking promotes greater financial inclusion. Countries with an enabling legal framework for branchless banking activities tend to have a higher share of adult population with an account at a financial institution. E-money and agent banking benefit farmers by enabling them to receive payments through mobile phone-based accounts or via a local agent rather than having to travel to a financial institution or to a producer to obtain payment, which reduces transaction costs and the risks associated with holding cash.

Countries should adopt branchless banking frameworks that include a wide array of financial service providers, as this encourages competition and reduces transaction costs for customers. In the past year, 10 countries reformed their e-money regulations including Ghana, Tanzania and Zambia. Of the 56 countries that now have laws on e-money, only two-thirds allow non-financial institutions to issue e-money. In addition, only 15 of the 27 countries with laws on agent banking allow individuals, as well as businesses, to act as banking agents (figure 5.2).

Ghana scores well in branchless banking due to amendments to both its “Agent Guidelines” and its “Guidelines for E-money Issuers in Ghana, 2015.” The new “Agent Guidelines” allow both individuals and businesses to operate as agents and increases the number of minimum standards required to qualify as a bank agent. The “Guidelines for E-money Issuers in Ghana, 2015” allow non-financial institutions to issue e-money and provide high standards such as a minimum capital requirement, existence of internal control mechanisms to comply with anti-money laundering and combatting of financing terrorism (AML/CFT) standards and consumer protection mechanisms to obtain a license. In addition, in 2015, WAMU countries strengthened their e-money regulations when they adopted a regulation governing the conditions and terms of e-money issuers’ activities in WAMU. The regulation set new requirements for interoperability and consumer protection measures to obtain a license as an e-money issuer. Previously there were no such requirements. The regulation also strengthens consumer protection standards for e-money issuers by requiring 100% of consumers’ funds to be safeguarded in a prudentially regulated financial institution.
Reducing risk through performance guarantees for warehouse receipts

A performance guarantee is a requirement placed on a warehouse operator to secure performance of obligations as an operator. Performance guarantees reduce both the depositor’s risk in depositing goods in a warehouse and the bank’s risk in lending against a warehouse receipt. Therefore, a strong legal framework for warehouse receipts includes at least one performance guarantee. The finance topic measured the existence of the following three types of performance guarantees, namely: 1) filing a bond with the regulator; 2) paying into an indemnity fund; and 3) insuring the warehouse and stored goods against fire, theft and natural disasters. Among the 36 countries with a legal framework for warehouse receipts, 24 require at least one performance guarantee, among which 11 countries require two (figure 5.3). Requiring warehouse operators to insure the warehouse and stored goods against theft and natural disasters is the most common form of performance guarantee, with almost 60% of countries requiring insurance, including Colombia, Ethiopia and Romania. Filing a bond with the regulator is the second most common form of performance guarantee, with 28% of countries requiring this option.

Conclusion

Financial regulations are rarely established to serve certain sectors. Instead, a comprehensive financial regulatory environment can have beneficial effects for all sectors, including agriculture.

For example, regulations that are appropriate to the portfolio risks and operating characteristics of MFIs and financial cooperatives are essential to ensure their smooth operation serving generally across all sectors. Having these regulations in place is particularly important for agriculture because it enables these institutions to better provide credit and financial services to smallholder farmers and agribusinesses who are usually excluded from traditional banking credit or services. Kenya and Vietnam are among the countries that have established either the same or slightly more stringent requirements on the capital adequacy ratio and provisioning rules for MFIs, as compared with commercial banks. In response to the recent boom in branchless banking activities, regulations are needed to engender trust and transparency in such systems, promote innovation, as well as minimize risk, protect customers and ensure system stability. The majority of OECD high-income countries have established legislation regulating e-money activities, which helps to create a level playing field for financial institutions and non-financial institutions that are active in this area. With regards to movable collateral, comprehensive legal frameworks on secured transactions and warehouse receipts, such as in Rwanda, allow borrowers to use their agricultural assets to obtain essential credit.

Figure 5.3 | Most countries require at least one performance guarantee in a warehouse receipts system
NOTES

Markets
Market accessibility is vital to the growth and prosperity of agribusiness, and the surrounding regulatory environment has a direct effect on the ability of farmers to bring their products to market and respond to growing global food demand. However, agricultural products, such as fruits and vegetables, cereals or commodities such as tea, coffee and cocoa beans, cannot be marketed until companies have satisfied relevant legal requirements, including registrations, licenses and memberships, and products have met safety and quality standards.1

Trade is facilitated where licensing requirements and export procedures are less burdensome, time-consuming and costly. Furthermore, commercially-oriented agricultural production requires strong plant protection regulations that ensure reliable pest management in the field and robust inspection and verification practices at the border.2 Pest and disease outbreaks can lead to infested products, reduced yields or even crop failures, all of which compromise the ability of producers to achieve consistent production levels and meet phytosanitary standards in destination markets.3

The 2015 outbreak of the bacterium *Xylella fastidiosa* in Italy’s Salento region, for example, affected more than 1 of the 11 million olive trees there. Buffer and containment zones have been established to stop the bacteria from spreading, but Italian olive and olive oil production is projected to drop in the coming years.5 Regulatory good practices include a clear mandate for national plant protection authorities to conduct pest surveillance and for farmers to report unusual pest occurrences, to promptly deal with any outbreaks and manage endemic pest populations.6

COEXPHAL, founded by 17 agricultural cooperatives in 1977, is the Association of Fruit and Vegetable Producers of Almería in southeast Spain. Throughout the years, it has provided a wide range of services and helped its members implement innovative changes in production and processing activities. For example, to address food safety and plant health concerns, COEXPHAL established its own laboratory to perform quality testing and analysis for farmers and cooperatives, facilitating compliance with horticultural product standards in destination markets. It also led the implementation of integrated pest management strategies to encourage more sustainable production practices. As a result, COEXPHAL now has market access in 43 countries, represents 65% of exports and 70% of fruit and vegetable production in Almeria, and can directly sell consumer-ready products to large buyers such as supermarket chains.1

A fruit and vegetable stand in Kampala, Uganda. Photo: Arne Hoel / World Bank.
Market access can also be enhanced when farmers participate in producer organizations, such as cooperatives and other forms of associations, which can aggregate production and facilitate compliance with regulatory requirements. In addition, producer organizations enable farmer members to achieve economies of scale that can, in turn, result in more profitable and stable market participation. In Europe, producer organizations process and market 60% of agricultural commodities and about 50% of input supply. In Brazil, cooperatives are responsible for 37% of agricultural GDP, and in Egypt, 4 million farmers earn their income through cooperative membership.

What do the markets indicators measure?

EBA markets indicators measure laws and regulations that impact access to agricultural markets for producers and agribusinesses (table 6.1). The indicators are organized as follows:

**Agricultural trade:** Agricultural trade plays an important role in securing greater quantity, wider variety and better quality food at lower prices. Trade also creates economies of scale, establishes and strengthens product value chains, facilitates the transfer of technology and attracts foreign investment. This indicator measures regulatory requirements on trade in agricultural products, including price controls and auction requirements, mandatory trader-level licenses and memberships to operate in the domestic and/or export market, phytosanitary certification procedures and the time and cost to obtain mandatory, agriculture-specific, per-shipment export documents.

**Plant protection:** Strong plant protection frameworks protect crops from pests and diseases by regulating the processes and practices to which agricultural products may be subjected during production, processing and trade. This indicator measures key aspects of phytosanitary legislation on the management and control of pests and diseases, including the existence and accessibility of pest lists and information, pest surveillance and reporting obligations, risk analysis and risk-based inspections on agricultural imports.

**Producer organizations:** Not only can producer organizations enable members to access inputs at lower costs, but they can also facilitate sales, negotiate long-term agricultural contracts and enter high-value, reliable value chains for the benefit of their members. This indicator measures key issues relating to the establishment and operation of producer organizations, including capital and membership requirements, profit distribution, government involvement, nondiscrimination, measures to promote female participation and procedures to establish a producer organization.

Additional data on contract farming were collected but not scored and are presented in appendix D.

### Table 6.1 | What do the markets indicators measure?

| AGRICULTURAL TRADE | • Domestic price controls  
| • Auctions and/or fixed market places  
| • Licenses, memberships or registration requirements to trade in the domestic market and export  
| • Per-shipment export documents (number, time and cost)  |
| PLANT PROTECTION | • Existence of a designated agency to conduct pest surveillance on plants  
| • List of regulated quarantine pests and pest databases  
| • Legal obligation and penalties on land owners/users to report pest outbreaks  
| • Existence of designated agency to conduct pest risk analysis (PRA)  
| • Publicly available PRA reports (online) and risk-based phytosanitary import inspections  |
| PRODUCER ORGANIZATIONS | • Registration process (statutory time for registration; reasons for rejection)  
| • Minimum capital requirements to establish a producer organization  
| • Rules on membership (legal and natural persons, nationality, government) and nonmember participation  
| • Nondiscrimination requirements and gender-equality promotion  
| • Distribution of profits and dividends  |

obligations on citizens to report pest outbreaks. In introduced a new plant protection law, which creates countries in other regions. The Government of Rwanda regulatory reforms in the area of plant protection than year more countries in Sub-Saharan Africa adopted information on plant pests and diseases. Nevertheless, last Tanzania have a publicly available database with infor
do not have a clearly designated government agency include any. In Sub-Saharan Africa, the region that perfor
tion of the Netherlands, Poland and Spain showcases country performance with respect to plant protection regulations varies the most. The phytosanitary legislation of the Netherlands, Poland and Spain showcases almost all the good practices covered by this indicator, whereas the laws of Haiti, Liberia and Myanmar do not include any. In Sub-Saharan Africa, the region that performs the worst on this indicator, 7 of the 21 countries do not have a clearly designated government agency to conduct pest surveillance and only Senegal and Tanzania have a publicly available database with information on plant pests and diseases. Nevertheless, last year more countries in Sub-Saharan Africa adopted regulatory reforms in the area of plant protection than countries in other regions. The Government of Rwanda introduced a new plant protection law, which creates obligations on citizens to report pest outbreaks. In Uganda, the new 2015 Plant Protection and Health Act provides that phytosanitary import inspections can now be carried out on a risk-management basis. Finally, the list of regulated quarantine pests for the Government of Sudan is now available on the International Plant Protection Convention (IPPC) website, as is the case for Nicaragua, which is the only country outside of Sub-Saharan Africa that improved on the plant protection indicator this year.

Regarding the total time and cost to obtain per-shipment documents to export agricultural products, OECD high-income countries have the most streamlined process—on average, it costs 0.0% income per capita and takes 0.4 days (figure 6.1). For example, due to regional integration in the European Union (EU), companies do not have to obtain any additional agriculture-specific documents when trading products between EU member states. In East Asia and Pacific, South Asia and Sub-Saharan Africa, however, at least two documents are required for each shipment. It is most time-consuming to complete the process in Sub-Saharan African countries, taking 6.0 days on average, and the documents are most expensive in South Asia and Sub-Saharan Africa, costing 2.5% income per capita on average. That said, the Government of Kenya has taken steps to reform and improve the export process. Not only did the Government of Kenya reduce the official fees for the phytosanitary certificate, but it also abolished the requirement to obtain an export release order and pay a special tea levy to the Tea Directorate, which was previously imposed on a per-shipment basis.

At the commodity level, the process to obtain the mandatory documents to export perishable products (for example, fruits and vegetables) is on average more efficient and less costly than that for exports of cereals and cash crop products such as coffee, cocoa and tea, which are more often subject to specific export permits and additional safety and quality control procedures.

How do countries perform on the markets indicators?

Countries do not perform uniformly across the markets indicators (table 6.2). For example, the 2013 Cooperative Societies Act of Tanzania sets out a number of regulatory good practices that can facilitate the capitalization and growth of producer organizations, such as the provision of nonmember shares and dividends that can be freely established, which place the country’s performance on the producer organizations indicator above the global average. However, to obtain the four documents required to export agricultural products from Tanzania, it takes 16 days and costs 4.3% income per capita, which is more cumbersome and costly than other Sub-Saharan African countries.

For OECD high-income countries such as Chile, even if they are among the top performers on average, there is potential for improvement in their rules governing producer organizations, such as the adoption of timeframes for the review of applications to establish a producer organization and potential for nonmembers to invest in producer groups.

Among the three indicators under the markets topic, country performance with respect to plant protection regulations varies the most. The phytosanitary legislation of the Netherlands, Poland and Spain showcases almost all the good practices covered by this indicator, whereas the laws of Haiti, Liberia and Myanmar do not include any. In Sub-Saharan Africa, the region that performs the worst on this indicator, 7 of the 21 countries do not have a clearly designated government agency to conduct pest surveillance and only Senegal and Tanzania have a publicly available database with information on plant pests and diseases. Nevertheless, last year more countries in Sub-Saharan Africa adopted regulatory reforms in the area of plant protection than countries in other regions. The Government of Rwanda introduced a new plant protection law, which creates obligations on citizens to report pest outbreaks. In

What are the regulatory good practices?

Box 6.1 highlights regulatory good practices for markets and some countries that implement such practices.

Streamlining phytosanitary certification procedures

The sanitary and phytosanitary rules, technical standards and product regulations that importing countries apply to agricultural products often lead to lengthy and costly export processes, including complex phytosanitary inspection and certification procedures in the exporting country. Improving the efficiency of these processes can reduce the burden on the export businesses and potentially encourage larger volumes of trade.
Phytosanitary certification procedures, in particular, are subject to duplicative, costly and inefficient processes due to the need for product inspection and, at times, sampling and laboratory testing. To increase efficiency in a phytosanitary certification system, having an electronic means to initiate the phytosanitary certification process and allowing for on-site inspection and issuance of the certificate, would allow products to be packed and sealed in the same place as the inspection and certificate issuance are carried out. This process would reduce associated transport and logistics costs, and allow for immediate shipment for export. In countries that have electronic systems and allow on-site inspection and issuance of phytosanitary certificates, the time and cost to obtain a phytosanitary certificate are lower than in those that still only allow for paper-based applications and offsite inspection and certificate issuance (figure 6.2).

Of the 62 countries studied, 19 provide for an electronic means to initiate the phytosanitary certification process, which includes either email or the use of an online portal. In 33 countries, applications continue to be submitted in hard copy form to the nearest plant protection office or electronic systems are not currently working. The ability of plant protection officers to conduct inspections and issue phytosanitary certificates on-site where products are produced, processed, packaged and/or stored is possible in only 19 countries.

Chile, Kenya, Korea, and the Netherlands also have the capacity to generate, issue and send phytosanitary certificates in electronic form (ePhyto); these certificates can be sent electronically to destination countries that have ePhyto systems in place. The ePhyto mechanism allows for the exchange of phytosanitary certificates between governments based on bilateral agreements; it can increase the security and efficiency of government certification processes and, in turn, facilitate trade. In Chile, for example, electronic phytosanitary certificates are used for agricultural exports to China. The system was initially tested with grapes and, due to its success, was later rolled out to all fruit and vegetable products. However, this was only made possible through sustained bilateral efforts to standardize the electronic exchange of information and ensure that software interfaces could communicate directly with one another in a secure and timely manner. In an effort to facilitate the expansion of ePhyto globally, the IPPC Secretariat recently launched the Global ePhyto Solution project to develop a standardized approach to the security and method of exchange of certificates, to ensure that all of their contracting parties are able to easily use ePhyto processes.

Open agricultural markets

include unpredictable and/or discretionary policies, price controls, and non-tariff barriers such as complex licensing systems.18

Price volatility, particularly in essential commodities such as grains or high-value exports such as cocoa, coffee or tea, is a traditional driving force behind government regulation, particularly price controls, with the ultimate goal being to keep food prices low or to ensure farmers receive a minimum guaranteed price for their outputs. Price controls have been a common policy choice due to the social stigma surrounding other assistance mechanisms, such as direct payments. However, a broad evidence base now exists to show that price controls can artificially increase production, distort the land market, raise prices for consumers and disrupt international trade. Indeed, both mandatory and recommended prices are considered to have market distorting effects.19 Although the majority of countries do not have any explicit price controls in place, 14 operate some form of mandatory price control mechanism on fruits, cereals or other traditional cash-crop commodities such as cocoa, coffee and tea, and 9 of those countries are located in Sub-Saharan Africa (figure 6.3).

In some cases, regulations prescribe the mode and location for agricultural trade, for example, via auction and/or at a fixed physical marketplace. Auction requirements apply in 6 of the 62 countries. In addition, in India, the majority of state governments operate a strict “mandi” system, which involves mandatory, fixed physical markets where farmers are required to sell their products often via auction and/or using commission agents. Around 7,500 mandis currently exist, each being regulated by different state-level laws and covering various agricultural products.20 Although licenses do not apply to farmers or other sellers of agricultural products, buyers have to obtain various licenses depending on their particular activity, and traditionally each license is attached to a physical unit or space in the market. Thus, when all units are occupied, no new licenses can be issued. Of the four Indian states studied in EBA 2017, only Bihar has abolished the mandi system (in 2006) in an effort to open up the market and reduce the role of middlemen. In Maharashtra, although the mandi system is still in place, a 2006 legal reform allowed for direct marketing contracts between agribusinesses and farmers, as well as for new private market areas to be established by individual businesses.

Facilitating the establishment of producer organizations

Producer organizations can be a useful vehicle to achieve market integration for their members. At the outset, ease of establishment can be a major obstacle to the development of producer organizations in the rural economy. Governments may establish minimum capital requirements to address undercapitalization issues, which are especially prevalent among agricultural cooperatives. However, minimum capital requirements directly hinder entrepreneurship and business growth, and capital formation is a major challenge for smallholder farmers. Where a minimum amount of
Almost one-quarter of the countries studied impose agriculture-specific price controls, primarily on cereals and cash crops. In Korea the minimum capital requirement to establish a producer organization is significantly higher than in other countries, which operates as a severe barrier to the establishment of new agricultural cooperatives. Historically, the Korean agricultural cooperative sector developed largely under government guidance and direction, and through the network of the National Agricultural Cooperative Federation. More than 2 million farmers are currently members of the 1,134 cooperatives in Korea, comprising the majority of the country’s farming population.

In Denmark, no minimum capital requirements apply. No specific legislation on cooperatives or other producer groups exists, and such entities are subject to the same laws as other commercial entities. As a result, the regulatory framework leaves producer organizations to adopt statutes that best fit their activity and establish their own principles of cooperative governance. Notwithstanding the absence of a special legal framework, however, cooperatives and other types of agricultural entities are thriving, with a high market share of around 65% in the agricultural sector, and cooperatives are altogether responsible for around 10% of GDP. A similar situation exists in the Netherlands, where the regulation of cooperatives is also minimal.

Conclusion

Open markets that are unencumbered by unnecessary, overly complex or costly regulatory requirements are an important component of a dynamic agricultural sector. Government policies and regulations that impose burdensome marketing requirements on traders or exporters, as seen in India, or compromise pest management and control, can reduce farmers’ income. Furthermore, they inhibit agribusinesses from developing efficient value chains that can meet the food demands of large, urbanizing populations, both domestically and overseas. Producer organizations can help farmers to consolidate and play a more powerful role in the marketplace; where such organizations are underdeveloped, governments may wish to consider adopting or amending relevant laws to enable their establishment and operation as commercial entities protected from government involvement.
NOTES

2  In the context of the markets indicator, membership requirements refer to the obligation, for exporters, to be members of a specific association or organization to obtain the right to export the selected product or agricultural products more generally.

4  Murina and Nicita 2014.

6  International Plant Protection Convention (IPPC) 2012.

7  IFAD 2012.

8  Cogeca 2010.

10 Brookings 2012. Agricultural products are defined and grouped as cash crops, cereals, fruits and vegetables according to the Harmonized Commodity Description and Coding System 1996 version (HS 96). All data are sourced from the UN Comtrade Database, using the export data from 2009–13. For each country, the combination of the product and the partner country which represents the highest five-year average export value (in U.S. dollars) is selected. In addition, for countries where cash crops are selected as the export product, the HS 4-digit product within the category that is exported the most to the partner country is used for studying the legal and regulatory requirements. For example, coffee exports to the United States is selected for Colombia since coffee is the top product in the cash crop category and the USA is Colombia’s main trading partner.

Transport
Reliable and affordable food transport logistics services are essential to enable agricultural producers to reach consumers in growing urban areas. As such, transport can be considered a critical factor for urban food availability. Good transportation systems are required to minimize the time lag between harvest, processing and retail, and provide adequate temperature control to preserve the quality and shelf life of perishable products as they are transported to markets. Food losses during transport are frequently due to mechanical injury, spillage or leakage, which typically go unrecorded. In addition, transport inefficiencies may decrease the food supply to local markets and reduce farmer profits.

Access to efficient transport logistics as part of modern supply chains has been found to increase farmer income by 10 to 100%. Transport costs can account for one-third of the price of agriculture inputs in some Sub-Saharan African countries, which can lead to higher food prices. High marketing costs discourage farmers from commercializing their production and can be traced back to poor road quality, isolation from markets, lack of vehicles and inefficient trucking logistics. Transportation services are also critical in mature economies like the United States, where the majority of domestic agricultural freight is still transported by road and agriculture is the largest user of freight transportation. For instance, trucks transport food supplies for more than 80% of US cities and communities.

Small trucking companies in Java, Indonesia offer relatively cheap services but at the expense of service reliability and often with the resulting late delivery of goods. Strengthening the legal framework by establishing a road transport licensing system that imposes certain minimum quality standards, including professional certification for drivers and regular vehicle technical inspections, can reduce overall road transport costs by 7%, according to a recent empirical study. Indonesian road transport is responsible for more than 90% of all freight and is the largest contributor to high logistic costs in the country. Such high costs cause remote areas to experience more volatile food prices.
What do the transport indicators measure?

EBA transport indicators measure the legal and regulatory framework that affects the provision of commercial road transportation services for agricultural products, including licenses, quality of trucking operations and cross-border transportation (table 7.1).

The indicators are organized as follows:

**Trucking licenses and operations:** Competition among truck service providers is key to curbing transport prices, increasing service quality and mitigating road transport inefficiencies.\(^{11}\) This indicator assesses the extent to which regulations provide for a clear, transparent and efficient system for accessing and operating in the domestic transport sector. Strong legal systems reconcile the ease of accessing the market with minimum quality criteria to ensure food safety and environmental protection. This indicator covers the following:

- **Licensing regimes for transport operators.** Excessive or cumbersome regulation for market entry can lower firm productivity\(^{12}\) and promote concentration.\(^{13}\) Thus, easing the process to obtain licenses for transport vehicles and operations is considered to be among the most important ways to improve trade and transport. The data cover the different licensing regimes, their time and cost requirements, and the existence of online platforms for submitting a license application.

- **Nontechnical requirements to obtain a truck license.** Unjustified license requirements can artificially limit competition among transport providers and ultimately lead to higher transport prices and lower service quality. The data examine the existence of potentially discriminatory or unnecessary requirements relating to nationality, company size, operational capacity, professional affiliation or gender, among others.

**Special regulations applicable to the transport of agri-food products.** Given the potential impact of transport conditions on food safety and hygiene, transport regulations should include rules applicable to agriculture and food products. The data cover aspects such as vehicle refrigeration, insulation, co-mingling prohibitions and mandatory cleaning protocols, among others.

**Transport documents.** Road transport documents facilitate and standardize transactions, and have the capacity to increase trade and reduce risks and informality. A strong legal framework will institute written documents defining the conditions of carriage and a description of goods transported.

**Pricing and freight allocation mechanisms.** Price-setting or quantitative mandatory guidelines distort the market and restrain competition. The data focus on the presence of legally-binding queueing systems or mandatory road transport prices.

**Cross-border transportation:** Allowing foreign trucks to transport third-country cargo is one means of improving trade and transport.\(^{14}\) Increasing the exposure of domestic truck operators to wider regional competition has also been cited as a determinant in lowering transport prices in Southern Africa.\(^{15}\) The cross-border transportation indicator measures the following:

- **Cross-border licensing.** The data cover the legal and regulatory framework governing cross-border transport between each country and its largest trading partner, including transport rights granted to foreign companies and cross-border licenses applicable to foreign trucks.

**Limitations to foreign competitors.** Despite regional and international efforts to liberalize trucking sectors, quantitative and operational restrictions to foreign competition still exist. These data identify potential

limitations such as quotas on the number of cross-border licenses that can be issued and mandatory corridors through which foreign trucks must operate.

Additional data on quality control for truck operations were collected but not scored, and are presented in appendix D.

How do countries perform on the transport indicators?

Countries that perform well on the trucking licenses and operations indicator also tend to have greater logistics capacity, according to the Logistics Performance Index (LPI) (figure 7.1). As the most common type of transportation in developing countries, road transport is an essential precursor for effective general transport. Country performance for trucking licenses and operations follows a distribution pattern similar to the LPI, thus implying an underlying relationship between the quality of road transport market access regulations and the overall quality of trade logistics infrastructure. Both indicators exhibit similar trends by income levels. High-income OECD countries perform better on the transport indicators due to an efficient regulatory framework for truck licenses and domestic operations, a comprehensive system for ensuring the quality of truck operations and a high degree of openness to foreign competition. Particularly, Spain, Romania, Denmark and Italy display the strongest performance on the regulations measured, driven by a strong body of harmonized regulations (table 7.2). Egypt, Ghana, Haiti, the Kyrgyz Republic and Liberia perform poorly on the transport indicators due to their domestic and cross-border trucking regulations; they do not require a license at the company level, they do not establish norms for the transport of perishable products and they do not have any rules on cross-border transport.

Regarding the time to obtain licenses, it generally takes longer to obtain a license in high-income OECD countries where company-level licenses are used, as compared with low-income countries where individual truck-level licensing is predominant (figure 7.2). Truck-level licenses can generally be issued faster because fewer quality standards apply. However, the average cost in countries with company-level licenses is almost five times lower than that of low-income countries. In Poland, for example, domestic company-level licenses take 90 days and cost 1.8% of income per capita on average to be processed, while in Uganda it takes only one day but almost 6% of income per capita to obtain a domestic truck-level license. In addition, even though shorter times are recorded for truck-level licenses, countries with company-level licenses tend to compensate operators with longer license validities; for example, five years is the average validity across the 21 countries operating a company-level system, as compared with one year for truck-level licenses. In certain cases, company-level licenses may also be unlimited (Colombia, Mexico, Serbia or Spain).

What are the regulatory good practices?

Box 7.1 highlights regulatory good practices and some countries that implement these practices.

Company-level licenses promote stronger quality standards

Company- and truck-level licensing regimes differ with respect to the number of vehicles allowed under each license, license validity, the obligation for operators to register and often the requirement that operators and managers are certified. Acknowledging that the best licensing systems may be tailored to local circumstances, company-level licenses are generally regarded as stronger systems to promote both market entry and quality-based standards in the transport sector. For example, while operators in Colombia benefit from the flexibility of a company-level license system that allows for whatever fleet size may be commercially desirable, truck operators in Tanzania must obtain individual truck licenses for each vehicle they want to operate.

Company-level licenses establish stricter quality standards on operators than truck-level or deregulated systems (see EU example in box 7.2). Across the 62 countries studied, company-level licenses require, on average, over six out of nine good practice quality criteria, a substantially higher number than the requirements that exist for truck-level licenses, which have four quality criteria in place, or countries with no licensing schemes, which have none. While vehicle-specific requirements such as vehicle registration, technical inspections and third-party insurance are common to all licensing types, operator requirements such as minimum financial capacity, good repute, permanent establishment and professional competence for managers and drivers are predominant in company-level license regimes.

Only one-third of the countries that EBA surveyed require a company-level license for truck operators. Bosnia and Herzegovina, Korea, Morocco, Rwanda, Tajikistan, Turkey and Vietnam adopted company-level licensing regimes during the past 15 years. Burkina Faso and Côte d’Ivoire have recently reformed their laws to move to a company-level system.

Improving cross-border transport and foreign competition

High transport prices and low service quality have been attributed to the lack of competition in the domestic market in Africa. In landlocked countries in the Western, Southern and Central African region, transport costs can contribute as much as 26% to import costs, which is more than three times the amount in developed economies. Increasing foreign participation in trucking and logistics services can help to increase competition, reduce prices and improve the quality of such services in the agriculture sector.

Figure 7.2 Stricter licensing requirements in high-income countries drive up the time required to obtain a license, but licenses are less costly

![Diagram showing average time (calendar days) and average cost (%GNI pc) across income levels.]

Source: EBA database.

Note: 49 of the 62 countries require a company-level license, a truck-level license, or both. The remaining 13 countries do not have any licensing requirements. Income-level grouping by country includes the following: low-income countries—Benin, Burkina Faso, Burundi, Ethiopia, Malawi, Mali, Mozambique, Nepal, Niger, Rwanda, Senegal, Tanzania, Uganda and Zimbabwe; lower-middle-income countries—Bangladesh, Bolivia, Cambodia, Cameroon, Côte d’Ivoire, India, Kenya, Lao PDR, Morocco, Myanmar, Nicaragua, Nigeria, Philippines, Sri Lanka, Tajikistan, Vietnam and Zambia; upper-middle-income countries—Bosnia and Herzegovina, Colombia, Jordan, Malaysia, Mexico, Peru, Romania, Serbia and Thailand; and high-income countries—Denmark, Greece, Italy, Korea, Rep., Netherlands, Poland, Spain and Uruguay. Turkey was excluded from its income grouping (upper-middle income) for graphing purposes given its extreme values for cost required.

Box 7.2 | The EU example

Through Regulation (EC) 1071/2009 and 1072/2009, the EU adopted a harmonized, company-level license system based on a common set of quality conditions with which all EU truck operators must comply permanently. The criteria include sound financial capacity, good repute and professional competence for managers and permanent establishment. This approach, which grants unrestricted market access to any EU Member State, constitutes a source of inspiration for other countries in the Europe and Central Asia (ECA), Middle East and North Africa (MENA) and Sub-Saharan Africa (SSA) regions, which still rely predominantly on truck-level or no license regimes. Some countries such as Burkina Faso or Côte d’Ivoire are in the process reforming their truck-level licensing schemes accordingly.
by foreign trucking companies led to a 20% reduction in road transport prices. However, cross-border competition is typically hampered by restrictions on cabotage operations or on services from third countries not covered by a bilateral agreement.

Openness to foreign competition can be measured by the number of rights granted to foreign truck operators. While more than 92% of countries allow certain basic transport rights (transport and backhaul), others, such as triangular and cabotage rights, are allowed in only 68% and 13%—of the countries surveyed, respectively (figure 7.3). Across the EBA sample, only Korea, Malaysia, Myanmar, Sri Lanka and Thailand do not allow trucks registered in their largest trading partner to enter their territory at all. Cabotage rights, the most permissive regime for foreign operators, are observed in only eight countries, namely: Denmark, Greece, Italy, the Netherlands, Poland, Romania, Serbia and Spain. Even in these countries, cabotage rights are subject to certain limitations such as the maximum number of cabotage operations and specific time limits.

Regional trade integration dynamics can also stimulate cross-border transport by harmonizing market access criteria and establishing most-favored nation clauses. The data show that countries regulating cross-border transport through regional transport agreements record a higher number of good practices than countries doing so bilaterally. While 90% of countries with a regional agreement in place require a cross-border license, only 65% do so when regulated bilaterally. Similarly, the average number of transport rights granted to trading partners under regional agreements is 20% higher than its bilateral equivalent. Moreover, quotas to the number of cross-border licenses issued and the existence of specific transit corridors are all limitations that are less frequent under regional agreements than under bilateral ones (20% and 14% lower, respectively). The East African Community (EAC) is a good example of a regional trade agreement that harmonizes truck licensing requirements; the agreement guarantees four of five transport rights and removes quantitative or qualitative limitations on the number of trucks licensed in any of the five EAC member countries that can operate in the domestic market of another member.

Strong transport regulations promote food safety and reduce food waste

In developing countries, 40% of food losses occur at the post-harvest and handling stages of the value chain, including degradation and spillage from poor transportation conditions. Strong legal frameworks for agricultural transport include specific provisions for the transport of agri-food products. These provisions include rules such as mandatory refrigeration standards, special insulation and roofing conditions, cleaning protocols, special labelling requirements and a prohibition on comingleing of certain items, all of which seek to prevent foodborne diseases and contamination, avoid spillage and ensure the quality of the products being transported. Countries with stronger regulations pertaining to food products have a much lower incidence of food waste.

Source: EBA database.
Only 38% of the economies studied have implemented specific regulations that seek to ensure food safety during transportation. The prevalence of agri-food transport regulations is predominant in high- and upper-middle-income economies (figure 7.4). A very small number of countries in the low- and lower-middle-income tiers, including Cameroon, Guatemala, India, Kazakhstan, Nicaragua, Senegal and Tajikistan, have such rules in place. For example, since 2010 Nicaragua has imposed specific requirements for safe transport including vehicle refrigeration specifications, cleaning protocols, loading and unloading procedures and mandatory documentation requirements.32 Other low- and middle-income countries limit such regulations to one or two particularly relevant commodities for that country, rather than the agri-food sector more broadly. For instance, Cameroon recently issued a regulation dealing with the safe transport of cocoa and the Russian Federation has specific regulations on wheat safety.

**Conclusion**

Strong and efficient truck licensing frameworks that are nondiscriminatory, transparent and conditional on minimum quality standards, can play an important role in leveling the playing field for transport service providers and ultimately contribute to better access to such services in rural areas. As suggested by the EU example, opening up truck service markets to foreign competition is another important regulatory component that can reduce fragmentation, stimulate the adoption of improved standards and reduce overall transport costs.

16 LPI is a World Bank knowledge product measuring logistic “friendliness” perceptions as reported by freight forwarders and express carriers. The 2016 edition provides data on 160 countries, 60 of which are also part of EBA.

17 The transport topic categorizes licenses based on level: company, truck, both company and truck or the absence of a license.

18 Burkina Faso recently established a company-level licensing system, in force since October 2016. The new license will comprise quality criteria to access the market and have a validity of five years. With the new regulation, each truck operator will be able to have an unlimited number of trucks under the license.

19 In 2015, Côte d’Ivoire introduced a company-level-based operator licensing system with clear quality criteria to access the profession. The decree also establishes strategic plans containing an estimation of the demand for transport services, a registry of licensed operators and their fleets, and user satisfaction rates, among others. As a result of this reform, Côte d’Ivoire is now the best performer in the “truck licenses and operations” sub-indicator of the ECOWAS region.

20 Serbia will fully harmonize its licensing system to EU requirements by February 2017. The new company-level license will establish quality criteria including good repute, Certificate of Professional Competence (CPC) for drivers and managers, financial capacity standards and a more generous validity, and will remove the limitation to the number of trucks.

23 Raballand et al. 2008.
24 Ibid.
25 Record et al. 2014.
26 By definition, cabotage rights are defined as follows: a truck registered in country A is able to pick up agricultural goods in country B and deliver them to a different point in country B.

27 By definition, triangular rights are defined as follows: a truck registered in country A is able to pick up agricultural goods in country B and transport them to be delivered into country C (assuming foreign country B is the final destination of the foreign truck).

28 Cabotage rights in EU countries are granted on the basis of Council Regulation (EC) No. 1072, 2009. In the case of Serbia, instead, cabotage rights are granted on the basis of a specific permit issued by the Ministry following the “Act on the Transport of Goods by Road.”

29 The East African Community is a regional intergovernmental organization with headquarters in Arusha, Tanzania and it currently comprises the following countries: Burundi, Kenya, Rwanda, Tanzania and Uganda.

30 FAO 2011.
31 Food losses in European countries where food safety transport regulations are extended are 9% for tubers, 0.5% for milk, 5% for fruits and vegetables and 1% for oilseeds and pulses; compared to 18%, 11%, 9% and 8% for Sub-Saharan Africa; 14%, 6%, 10% and 3% for Latin America; and 19%, 6%, 9% and 12% for South and South-East Asia, respectively (FAO 2011).

Water
Water is an essential input for crop production and vital to the task of increasing yields and feeding the world's growing population. Farmers must have access to sufficient quantities of water, at an adequate quality level and at the appropriate time and location, for crop production to be commercially viable. The availability of water for crop production depends on many factors: water scarcity, pollution, climate variability and increased demand for alternative uses. These factors necessitate improvements in water management.

At the farm level, although rain-fed agriculture remains predominant in many climates across the world, increased crop production in developing countries is expected to be achieved predominantly through irrigation. Irrigated land can be as much as twice as productive as nearby rain-fed land, and in developing countries irrigated agriculture already provides for approximately half of crop production, while comprising only 20% of all arable land. However, the availability of water for irrigation is constrained both by climatic conditions and the effectiveness of public water management. Moreover, any increase in the use of water for irrigation has important consequences for the overall water balance and the broader environment. It is also important to recognize that farmers' access to water for irrigation is also impacted by legal frameworks that extend beyond the direct relationship between regulators and water users to include measures affecting the resource itself as well as the infrastructure used to deliver water to the place of use at the time needed.

For the past nine years, Caroline has been growing rice on a four-hectare plot of land in a sprawling area of rice production near the banks of a river. Until recently, irrigation water pumped from the river allowed her to add an extra season of rice production per year, almost doubling her prior annual income. However, this year, the water level is significantly lower than average, and Caroline doesn't think she can grow anything this season. Some neighboring farmers believe that upstream users are extracting more than their allocated share of the river's water. Caroline agrees and notes that several large farms and industrial plants have appeared upstream in the past few years, but when she complained to the local river basin office tasked with allocation decisions, an official told her that they don't have information on those users—they “just sell water.” She is now concerned that her water permit is useless.
What do the water indicators measure?

The water indicators measure key elements within the legal and regulatory frameworks that impact farmers’ access to sufficient quantities of water, at an adequate quality level and at the time and location needed for crop production (table 8.1). The indicators are organized as follows:

Integrated water resources management: Water scarcity and degradation present significant practical constraints to both irrigation and agricultural development. In addition, while irrigation poses a variety of benefits for agricultural growth such as increased crop production, it can also heavily impact the availability of water resources. To this end, integrated water resources management (IWRM) promotes a view towards managing water in conjunction with land and other interconnected resources to achieve equitable and sustainable use. This indicator measures the regulatory framework applicable to water management in each country, including the establishment of institutions at the basin level, water planning, the development of information systems and water resource protection.

Individual water use for irrigation: Systems for water use permits are critical tools for managing and allocating water resources, including water for agriculture. Effective water use permit systems provide secure rights to water users and allow resource managers to review existing water uses and make meaningful allocation decisions in pursuit of broader planning and management goals. This indicator measures requirements for water use permits, as well as the quality of these permit requirements by examining public notice requirements, transfers, water use charges and enforcement measures.

How do countries perform on the water indicators?

Countries that have developed a strong legal framework for IWRM also tend to have a strong legal framework for individual water use for irrigation, with top- and middle-scoring countries only displaying minor deficiencies across the range of features covered by the water indicators. In these countries, the most common gaps include the absence of mandates to periodically update plans and information systems, limited promotion of water conservation and efficiency, and the absence of water use permit trading. In contrast, countries with weaker frameworks tend to have one or more concentrated areas of weakness impacting their frameworks, rather than across-the-board weakness. For example, Nepal’s legal framework for broader water resources management is largely absent with no planning or information systems in place, but it is relatively more comprehensive in supporting individual water use for irrigation; in contrast, the opposite is true in Bangladesh and Mali where water use permit requirements for medium-size farms are currently absent, but their water resource management frameworks are relatively stronger.

Spain’s legal framework represents the most comprehensive enabling framework for water management and use. Overall it provides for strong legal mechanisms that drive integrated water resources management (such as institutional frameworks, water inventorying and monitoring activities). In addition, it provides for a dynamic permit system for water use activities that facilitates transfer of water permits and other mechanisms that allow the system to adapt in response to changed circumstances (table 8.2).

Table 8.1 | What do the water indicators measure?

| INTEGRATED WATER RESOURCES MANAGEMENT | • Institutional mandates to manage water at basin levels  
| • Water planning at the national and basin levels 
| • Information systems on water resources and water use to support management decisions 
| • Resource protection mechanisms in cases of depletion or pollution |

| INDIVIDUAL WATER USE FOR IRRIGATION | • Abstraction and use permit requirements for medium-size farms (2–10 hectares) 
| • Transfers of active permits separate from land transactions 
| • Charging for the abstraction and use of water resources 
| • Enforcement of permit-related obligations |

Source: EBA database.
Context-specific concerns that may impact a country’s regulatory priorities include inter-annual water variability and water stress issues related to population growth and/or water scarcity. Countries with higher water variability tend to have developed stronger legal frameworks for water management and use in response (figure 8.1). Both Kenya and Mexico, for example, perform well on the water indicators, which illustrates how challenges identified in a country’s water resources situation can be a driver to adopt a strong legal framework for water management and use. Recognizing its water variability challenges, Kenya began a series of legal and regulatory reforms in 2002 with the introduction of a new Water Act (Cap. 372) and supporting regulations that upgraded and repealed outdated colonial-era legislation. In response to rapidly growing demand and overexploitation, Mexico has developed comprehensive legislation anchored by the 1992 National Water Law. In contrast to both Kenya and Mexico, Denmark’s relative abundance of stable, high-quality water resources and the absence of acute water stress issues may be one factor to explain why their legal framework for water management and use is currently less comprehensive than that of either Kenya or Mexico.

### What are the regulatory good practices?

Box 8.1 highlights regulatory good practices and some countries that implement these practices.

#### Informed institutions and planned water management

Institutional entities that manage water at the level of basins and aquifers are a critical component of IWRM and the starting point for improved planning, management and allocation of water among different water users. Across the countries studied, many have created institutional entities that manage water at the level of basins and aquifers, but fewer have taken steps toward the planning and information systems necessary to sufficiently inform those institutions and water users.

Approximately three-quarters of the countries studied have enacted legal provisions that require the

Source: EBA database.
establishment of institutions to manage water at the river basin level. Of those countries, 87% have actually established at least one of these institutions. Those countries that have a legal mandate but have not yet created any basin institutions tend to have relatively recent legislative or regulatory enactments, such as Cambodia (2015), Malawi (2013), Rwanda (2013) and Turkey (2012). Overall, 77% of all countries studied have at least one basin-level water management institution in place, taking into account those that have such entities without a legal mandate. Of those countries that do not have a legal mandate to establish basin institutions, 47% have them in practice, including Cameroon, Ghana, Senegal and Uganda. However, without a clear anchor in the legal framework, the role and impact of these institutions are typically restricted to consensus building, rather than exercising the necessary functions for planning and allocation of water resources.

Effective water planning and information systems guide water allocation decisions and thereby benefit farmers by helping to reduce the likelihood of situations where resources are over-allocated and irrigation needs go unmet. Of the countries studied, 44 require water planning at the basin level and 36 have actually completed at least one basin plan to date. To make good water planning decisions, water managers must have sufficient information about the current state of available resources, as well as the future demand from existing and potential water users. Furthermore, making information about water resources and water users available online helps to inform on-farm decisions to invest in irrigation development. But, whereas approximately 76% of the countries studied mandate the completion of an inventory of available water resources, only 56% currently have any inventory information made publicly available online (see figure 8.2). Similarly, although 61% of the countries studied require the creation and maintenance of a registry of water users, only 21% currently make any registry-related information publicly available online. For example, although more than half of low-income countries currently require a registry of water users, none of them currently makes any registry information available online.

The shared nature of water resources makes farmers dependent on institutions to monitor the ongoing status of water resources and to take actions to protect water resources from water depletion and pollution. These regulatory activities are critical because once resources have become degraded, recovery is complex and expensive, and at times impossible. Of the countries studied, 66% mandate monitoring of both water availability and water quality. However, far fewer of these countries require the government to actively publicize monitoring information. Overall, only 40% of the countries studied require water monitoring results to be made publicly available. In conjunction with inventory and registry information, publication of monitoring results helps to inform farmers about where it is reasonable to invest in irrigation and has important broader implications for the long-term ability to track protection of water-related ecosystems.

Protecting farmer investments through transparent permit systems

Strong water use permit systems benefit farmers by helping to ensure access to water in the face of potentially competing demands and strained resources. Moreover, at the broader level, as agriculture accounts for approximately 70% of water withdrawals globally and up to 90% in some country contexts, water use permit systems are a critical tool for managing and allocating water resources, including water for agriculture. Accordingly, an overwhelming majority of countries—82%—have put in place water use permit systems that are applicable to irrigation water use on medium-size farms (figure 8.3). Of the remaining 11 countries that do not require permits, four (Benin, Burkina Faso, Côte d’Ivoire and India) have instituted a partial system that requires these users to declare their water use, but offering no allocation control to water resource managers. The final seven countries (Bangladesh, Guatemala, Kyrgyz Republic, Liberia, Myanmar, Thailand and Turkey) do not have either requirement for individual water use for irrigation.

Significant variations are observed with respect to the quality of permit systems used to manage water withdrawals and those features that directly impact investment security for water users. For example, permit systems should require public notice of a new permit application before a decision is made, which promotes transparency and seeks to protect the rights of existing water users. Thus, for example, Armenia’s 2002 Water Code requires the agency issuing water permits to publish notice of pending water applications to allow for comments for 30 days prior to making a final decision. Only 27 of the countries studied have this legal requirement and only 21 of those set a mandatory minimum length for public notice. Recordkeeping requirements for water users are an additional transparency feature intended to facilitate water management and support water managers as they try to ensure sustainable water withdrawals. Romania provides an example of this good practice, as its water law requires water users to meter the quantity of water abstracted and keep records to be periodically submitted to the overseeing agency, which in turn must compile and make that information publicly available. Only 45% of countries studied have set a recordkeeping requirement in their legal framework.

Promoting efficiency and conservation through resource pricing

In response to water scarcity concerns and increasing demand, many countries are establishing the legal foundation necessary to charge user fees for the individual abstraction of water resources. An appropriate fee structure is one tool for water managers to promote efficient water use and water conservation, but, to this end, it is especially important to tailor any proposed legal approach to the specific country context, as defined by socioeconomic factors, the needs of smallholders and the most vulnerable water users, and the general profile of water users and farm sizes in the country. Nonetheless, when tailored to each country’s context, managing water as an economic good can
lead to efficient and equitable use, as well as promote water conservation. Morocco’s legal framework demonstrates good practices in this field by placing both an obligation on the user to pay charges and an obligation on the agency to collect charges, as well as by clearly defining how charges are calculated. In 40 of the countries studied, the legal framework requires medium- and large-size farms to pay a charge for water resources abstraction, but in only 29 of those countries does the legal framework specify the method for calculating the charge due (figure 8.4).

**Conclusion**

Water-related challenges vary widely between countries. One of the most important qualities of a country’s regulation for water management is the ability to meet the specific needs presented by the relevant country (and even basin) context. Nevertheless, while allowing for adequate tailoring, comprehensive laws and effective institutions generally contain a common range of tools and systems that allow for resilience in the face of challenging and/or changing conditions, such as water scarcity, fluctuations in availability or growing demand. Comprehensive regulation also supports the long-term durability of core practices for water management and use, which in the absence of a legal mandate may be compromised by future challenges related to available funding and/or political will.

Information and Communication Technology
Almost half of the global population lives in rural areas, where access to communications can be significantly more difficult. Mobile-broadband networks (3G or above) reach 84% of the global population, but only 67% of the rural population worldwide; in Africa, only about 25% of the population is using the internet. In Nepal, Cambodia, Lao PDR, Bangladesh and Myanmar less than 20% of the population is benefiting from the use of mobile internet.

The ability to connect to the internet in remote areas using mobile devices can make a significant difference to farmers in terms of their food security and commercial viability. It can provide them with a wide range of opportunities—from obtaining real-time data on market and transport prices, to information on seed varieties, pests and farming techniques, as well as basic information on the weather and analytical and management tools for production and marketing processes. Ultimately, the use of mobile applications and other information and communication technology (ICT)-enabled services can stimulate access to markets and increase the income of smallholder farmers by improving agricultural productivity, reducing costs for input suppliers and enhancing traceability and quality standards. For example, Indian farmers using the Reuters Market Light (RML) mobile information service, which reports on market prices, have benefited from an average increase in income of 5–15%.

In Kerala, a state in western India, 72% of adults eat fish at least once a day. Further, over one million people are directly employed in the fisheries sector. Between 1997 and 2001, mobile phone service was introduced throughout Kerala. In a short period of time, the adoption of mobile phones by fishermen and wholesalers was associated with a dramatic reduction in price dispersion and the complete elimination of waste. In particular, variation of prices across fish markets declined from 60–70 to 15% or less. Waste, averaging 5–8% of daily catch before mobile phones, was completely eliminated. As a result, fishermen’s profits increased on average by 8%. In Kerala, a state in western India, 72% of adults eat fish at least once a day. Further, over one million people are directly employed in the fisheries sector. Between 1997 and 2001, mobile phone service was introduced throughout Kerala. The most significant impediment for smallholder farmers to fully exploit the benefits of ICT in agriculture is the network coverage gap due to a lack of infrastructure and underdeveloped mobile networks. Policies and regulations should aim at closing this gap. One strategy to address these gaps is to establish a universal access fund, which is a multi-source financing mechanism to support ICT infrastructure development in rural areas. In addition, reducing regulatory burdens can encourage private sector investment. Cumbersome regulatory frameworks, such as two-layer licensing requirements, can hinder competition and inhibit the creation of innovative solutions that are responsive to users’ needs. This situation can prevent price reductions and the wider use of new, efficient technologies. Transparency creates greater predictability for mobile operators that have to take decisions on huge infrastructure investments and thereby encourages the expansion of networks to remote areas in a more sustainable manner.

What does the ICT indicator measure?

The ICT indicator measures laws, regulations and policies that promote an enabling environment for the provision and use of ICT services, particularly in rural areas. Given the significant capital investments required to provide ICT access in underserved areas, mobile operators often have no incentive to invest in network rollouts to remote areas without regulatory stimuli. As a result, network coverage gaps continue to affect predominantly rural areas where populations, income levels and potential profit margins are relatively low. The ICT indicator measures regulatory good practices that can provide some of these incentives (table 9.1). It focuses on the licensing framework and assesses the type of licensing regime used in a country, the validity of the operating license, the public availability of operating license costs, spectrum allocation strategies and the predictability of renewal conditions for operating and spectrum licenses. Additional data on universal access funds were not scored and are presented in the appendix D.

How do countries perform on the ICT indicator?

The higher quality of the licensing and regulation is associated with higher mobile internet market penetration (figure 9.1). Low-income countries in Sub-Saharan Africa display mobile internet market penetration levels below 20%, as compared to mobile internet market penetration levels above 60% for OECD high-income countries. Due to high capital investments required to expand mobile networks, higher income countries achieve faster universal access to ICT services.

Countries with stronger ICT regulations under the EBA ICT indicator (table 9.2) tend also to perform well on the GSMA’s Mobile Connectivity Index, which measures the strength of key enabling factors in a country (infrastructure, affordability, consumer readiness, content) to support universal adoption of the mobile internet (figure 9.2).

This result suggests that an enabling regulatory environment can contribute to better access to ICT services. European Union countries are among the top performers on both the ICT indicator and Mobile Connectivity Index, reflecting the significant harmonization efforts undertaken as part of the Digital Single Market Strategy initiative. The EU policy framework has been directed towards the creation of sound regulatory systems for electronic communications with simplified and inclusive rules that promote competition. The EU member states have transposed the provisions of the Authorization Directive 2002/20/EC into their national laws and regulations.

In contrast, countries that have implemented few regulatory good practices perform relatively poorly on the ICT indicator. For example, Ethiopia’s low performance is explained by the absence of technology and service neutrality, and the lack of liberalization in the market, among other factors. The Herfindahl-Hirschman Index, measuring market concentration on a scale of 0 (evenly distributed competition) to 10,000 (no competition), for Ethiopia is 10,000, reflecting the absence of

market competition in the telecommunications sector. In fact, the Ethiopian Telecommunications Corporation has the monopoly on telecommunications services in Ethiopia and there is little incentive to improve connectivity. This situation is reflected in the relatively low number of mobile cellular subscriptions in the country (42.76 per 100 people).12

**What are the regulatory good practices?**

Box 9.1 highlights regulatory good practices and some countries that implement these practices.

**General authorization regimes foster competition**

Traditionally, a licensing regime has been applied to authorize mobile operators to provide telecommunication services. Due to rapid technological development and the convergence of networks and services, a more open authorization framework is considered to be a good practice (box 9.1). General authorization regimes allow any telecommunication provider to offer electronic communications services, subject to general conditions applicable to all providers in the sector. They take the form of either open, license-exempt entry or simple notification requirements to start a telecommunications business. As a result, general authorization regimes increase competition by reducing barriers to entry and simplifying the regulatory process, and reduce administrative costs for regulators.

Only 10 countries out of the sample studied implement a general authorization regime (Colombia, Denmark, Georgia, Guatemala, Greece, Italy, Netherlands, Poland, Romania and Spain). In all 10 countries, administrative charges associated with general authorization regimes are publicly available. Furthermore, in most cases (Italy being an exception), the validity of general authorization is indefinite, which eliminates any uncertainty surrounding license renewal. In contrast, individual licenses are prone to regulatory uncertainty and ambiguity over licensing fees, renewal conditions and/or universal access obligations. Twenty-one of the 52 countries that impose individual licenses do not publish online the exact fees associated with obtaining an operating license. In 12 countries the renewal conditions of the operating licenses are also not clearly articulated in the existing regulations, and in 10 countries the validity of the individual operating license is less than 15 years. Such uncertainties regarding fees, renewal conditions and relatively short license terms make infrastructure investments riskier for mobile operators and thus deter investments into rural areas that are more challenging in terms of their commercial viability.

Promote greater coverage for rural areas through efficient spectrum management

To provide mobile services, telecommunication network providers have to obtain permission from the government to use radio frequencies or electromagnetic spectrum waves to operate within a network. Efficient spectrum management by the government incentivizes private sector investments to rollout networks to rural and remote areas. If mobile operators are permitted to use digital dividend bands, deployment costs are reduced, as fewer base stations are needed to cover the same geographic area. As such, good spectrum management that allows for a digital dividend to be licensed to mobile operators is useful for rural areas where population density is low and rollout costs are high. Among the 62 countries studied, only 24 have licensed the digital dividend spectrum to mobile operators (figure 9.3). No low-income countries and no countries located in the Sub-Saharan Africa region have implemented voluntarily spectrum trading. The countries that do not allow voluntarily spectrum trading are operating in less open telecommunication markets and in many cases do not implement the principle of technology and service neutrality that allows any service to be provided and any technology to be deployed within suggested frequency bands.

Conclusion

The type of licensing framework and efficiency of spectrum allocation can play important parts in encouraging the private sector to invest and rollout mobile networks in remote areas. The experience of EU countries suggests that greater liberalization of the telecommunications sector, including the introduction of general authorization regimes, supports ubiquitous connectivity. Efficient spectrum management is another regulatory stimulus than can provide benefits to mobile network operators through lower deployment costs and innovation opportunities, and to the end user in terms of greater access to ICT services.

Environmental Sustainability
Agriculture uses a range of natural resources that include water, soil and plant genetic resources. The quality and availability of these resources are fundamental to sustain production and respond to increasing global food demand. However, farming can also contribute to the depletion of natural resources including the loss of biodiversity, pollution of soil and water resources, and accelerated rates of soil erosion.

Despite its dependence on diverse genetic resources, modern farming can pose a challenge for the preservation of biodiversity. The increased use of improved seed varieties over local varieties, together with environmental degradation, urbanization and land clearing have contributed to genetic erosion. It is estimated that during the last century nearly 75% of plant genetic diversity has been lost, as farmers have replaced their genetically richer local varieties with genetically uniform, high-yielding varieties.2

As the largest user of water resources globally, the agricultural sector consumes approximately 69% of all water withdrawn3 and accounts for 36% of the land surface that is suitable for crop production.4 For example, chemical pesticides can pollute surface and groundwater through leaching and run off, causing negative effects in aquatic ecosystems and human health. Furthermore, deforestation and poor agricultural practices such as over cultivation and excessive grazing and water use can contribute to land degradation and desertification.5 A study conducted in Brazil shows that pasture and agricultural expansions have been the main causes of deforestation in the Amazon between 2000 and 2006.6

Mitigating the impact of farming on the environment is an important challenge to guarantee the long-term sustainability of agricultural production.
What do the EBA environmental sustainability indicators measure?

The EBA environmental sustainability indicators measure the legal and regulatory framework applicable to the management and sustainable use of natural resources that are vital for agricultural production. The data cover the following areas:

Conservation of plant genetic resources: The conservation of a diverse pool of genetic resources supports future crop production, since the development of adapted and improved seed varieties relies on the use of genetic variability, mainly found in local varieties and crop wild relatives. Data in this area cover the laws, regulations and policies that address the conservation of plant genetic resources in national genebanks. It also includes alternative conservation mechanisms at the farm and local level, such as community seed banks, diversity fairs or participatory plant breeding. These alternatives allow farmers to participate in the conservation, breeding and circulation of diverse seed.

Access and sustainable use of plant genetic resources: Farmers will preserve diverse genetic resources depending on the commercial value such resources can command in the market. Regulations and policies that facilitate the commercialization of seeds of local varieties through registries or simplified registration requirements are important ways to increase the availability of these genetically rich varieties in markets. Data cover laws and regulations that facilitate the circulation of seed in the informal sector, by recognizing farmer’s rights to reuse seed from their own harvests, and establish clear rules for accessing plant genetic resources.

Water quality management: Agriculture is a major cause of the degradation of surface and groundwater resources. Erosion and chemical runoff, such as nitrate pollution from excessive use of fertilizers and intensive livestock rearing, affect water quality. Data cover the institutional framework and regulations aimed at minimizing the contamination of water bodies from agricultural activities, such as buffer zones and setbacks, and regulations on hazardous and obsolete pesticides.

Soil health management: Land use plans allow governments to assess all current and potential uses in a territory and adopt the land use structure that best meets users’ needs while safeguarding valuable resources for future generations. Soil quality indicators are useful to better understand and monitor the impact of soil management practices. Data are collected on the legal and institutional frameworks applicable to land use planning and soil monitoring.

Some insights emerging from the data

Plant genetic resources

Improved seed varieties can provide significant benefits to farmers such as higher yields, resistance to certain diseases and more stable production. The development of these modern varieties relies on the use of genetic variability. National genebanks play a critical role in the preservation of genetic diversity, performing important functions such as the provision of genetic material to researchers, breeders and farmers for the development of new plant varieties or rebuilding agricultural production after conflicts or natural disasters. Among the 62 countries studied, 32 countries have established a national genebank.

Figure 10.1 | A limited number of countries have adopted laws that specifically regulate the commercialization of local varieties

![Figure 10.1](image-url)

Source: EBA database.
In addition to conserving plant genetic resources, genebanks also publish information associated with the plant material conserved to facilitate its use by potential users. Among the 32 countries that have established a national genebank, 16 publish information associated with their activities online. Although most of these countries are OECD high-income and upper-middle-income countries, Bolivia—a lower-middle-income country that recently joined the International Treaty on Plant Genetic Resources for Food and Agriculture—has a national genebank holding 18,434 collections of significant value to agricultural biodiversity, detailed information on which is available online.

The commercialization of local varieties has been recognized as a pathway to enhance the utilization and conservation of diverse genetic resources. Registries or simplified registration requirements can facilitate the commercialization of seed of local varieties. Registering local varieties in order to integrate them into formal channels can result in increased availability of diverse seed in the market.

To be registered and accepted for commercialization, most countries require a new variety to pass tests that evaluate distinctiveness, uniformity, and stability (DUS) and value of cultivation and use (VCU). However, as these tests are not appropriate for local varieties, which are genetically heterogeneous and adapted to local conditions, laws should provide for certain exceptions. Only one-quarter of the countries studied explicitly support this practice (figure 10.1). Of these, Denmark, Greece, Italy, the Netherlands, Poland, Romania and Spain, and as European Union (EU) members, have implemented EU Directive 2008/62/EC establishing certain exceptions for the acceptance and marketing of certain crop varieties that are adapted to local conditions and threatened by genetic erosion. Other countries with similar exceptions include Bangladesh, India, Nepal, Peru, Thailand and Uruguay. In Uruguay, for example, the range of genetic heterogeneity allowed for local varieties during testing is higher than for conventional varieties and VCU tests are not required.

**Water quality management**

As stated above, agricultural production is a principal cause of surface and groundwater resources degradation. Forest buffers, a type of restrictions on land use, can address pollution caused by pesticides and excess fertilizers by functioning as filters that trap sediment, excess nutrients, pesticides and other chemical contaminants that would otherwise reach water sources. These practices are infrequently adopted by the countries studied; only 26 countries have regulations that provide for buffer zones or setbacks adjacent to water bodies, most of which are high-income and upper-middle-income countries. In Rwanda, for example, the law on environmental protection specifically restricts agricultural activities within 10 meters of streams and rivers, and 50 meters of lakes; instead, these areas have been reserved for protection and conservation activities.

Pesticides should also be controlled to guard against water and soil pollution. Because their ingredients are toxic and have the potential to harm human and ecosystem health, governments should establish legal frameworks that regulate their distribution and use, especially in the case of hazardous pesticides. Fifty-seven of the countries studied (92%) have...
regulations that restrict the distribution and management of hazardous pesticide products. A large majority of high-income and upper-middle-income countries also impose specific rules to deal with obsolete or unwanted pesticides, which remain hazardous to the environment if improperly stored or disposed of. The adoption of this practice is less common in regions such as Sub-Saharan Africa, where only 12 of the 21 countries studied have regulations addressing obsolete pesticides, and South Asia, where only one of the four countries studied has such regulations in place. Regulations on this issue vary, from an obligation to include disposal methods on the pesticide label in Tanzania, to specialized facilities or collection services to safely collect and dispose of pesticides in Denmark and India.

Soil health management

Land use plans allow governments to assess all current and potential uses in a territory and adopt the land use structure that best meets users’ needs, while safeguarding valuable resources for future generations. Soil quality data provide useful information that governments, farmers and other stakeholders can use to monitor the impact of agricultural activities and inform land management decisions and farming practices.

Forty-eight of the countries studied have regulations mandating the development of land use plans, and 50 countries have an authority that monitors agricultural soil. While land use planning is mandated in all high-income OECD countries and East Asian and Pacific countries, it is less common in other regions such as South Asia, where only Nepal and India have such regulations (figure 10.2). In India, where land use planning is regulated by state-level governments, two of the studied states, Odisha and Maharashtra, mandate the development of land use plans, while Bihar and Uttar Pradesh do not make it a requirement. India is also implementing a soil monitoring program at the national level that aims to provide farmers with relevant data on soil health.

Conclusion

Agriculture depends on the availability of certain natural resources that are essential production inputs. In this context, the preservation of soil, water and plant genetic resources must remain a policy priority for governments and form part of their broader efforts to increase agricultural productivity. In particular, regulations that protect soil and water quality from the negative effects of fertilizers, pesticides and intensive livestock rearing are necessary to maintain vital ecosystems and guarantee the availability and utility of these resources for future generations. Institutions and regulations that safeguard diverse plant genetic resources are also crucial to ensure that the agricultural sector can respond to increased food demand and changing environmental conditions.

Gender
Identifying and analyzing the direct and indirect regulatory barriers to women’s full participation in the agricultural sector are essential to increasing productivity among women. Underlying constraints include unequal access to finance, land and agricultural inputs such as improved seeds, fertilizer and machinery. In addition, traditional norms may impact the utility of agricultural resources for women. The private sector has a role to play in addressing some of those constraints, and examples abound of agricultural and agribusiness companies that have designed creative initiatives to lift certain obstacles (box 11.1). In addition to those private sector-led efforts, regulatory initiatives are needed to secure land tenure for women, provide financial inclusion and market access, and increase women’s access to crucial agricultural inputs.2

In Sub-Saharan Africa, for example, although women make up around 40% of the agricultural labor force, their agricultural productivity lags far behind.3 Controlling for plot size and geographic factors, the gender productivity gap is estimated to be 66% in Niger and 23% in Tanzania.4 Not only does the gender productivity gap carry direct social and economic consequences for women farmers, but it also has a significant impact on the economy. In Malawi and Tanzania, for example, lower female productivity is estimated to cause annual losses of $100 million and $105 million, respectively.5 Research conducted in Burkina Faso further suggests that, at the household level, reallocating some agricultural inputs, and notably fertilizers, from the plots farmed by men to those farmed by women could lead to a 6% increase in output.6 Finally, closing the gender gap in agricultural productivity could lift tens of thousands of people out of poverty.7

Livinesi Mateche has always depended on farming as the main source of income in her home, located in the Mchinji district of Malawi. As she sought to improve her farming techniques, she joined the National Smallholder Farmers’ Alliance of Malawi (NASFAM), the largest independent smallholder-owned membership organization in the country. During the next planting season, she benefited from NASFAM’s farmer-to-farmer training program and learned good agricultural practices to improve crop quality and yields. Her membership benefits went beyond increased productivity. Thanks to NASFAM’s capacity to procure in bulk the members’ produce and transport them to points of sale domestically and abroad, Livinesi found more profitable commercial outlets for her production and her earnings increased substantially. Through her membership, Livinesi was able to improve her farming operation’s production and marketing prospects.1
Box 11.1 | How can the private sector support gender equality and increase women’s role in agribusinesses?

A 2015 report indicated that $12 trillion could be added to global income by 2025 by advancing women’s equality through the public, private and social sectors acting to close the gender gap. Correspondingly, agribusinesses have been engaged in numerous projects targeting women, including their role and influence in agriculture. For example, one project aims to help women overcome barriers in cocoa farming communities in Côte d’Ivoire, where only 4% of the cocoa farmers are women. The project provides female-only training to farmers to help them improve their agriculture and business skills, as well as offering gender-sensitive trainings for rural development agents. In Zambia, another project runs a training program for female tractor operators that seeks to address women’s participation in agricultural leadership roles, by offering women’s producer organizations farming tools and additional training free of charge.

Food conglomerates and other food companies are increasingly demanding that the raw materials they purchase are produced sustainably and in a gender-sensitive manner. For example, one project reviewed women’s role in the cocoa value chain in Côte d’Ivoire and Ghana. The project was based on the recognition that women’s leadership at all levels is required to achieve transformative change in the sector.

How can the EBA indicators help female farmers?

Although not all EBA indicators are specifically designed to capture differences in legal and regulatory treatments between men and women, they all measure aspects of the business environment that matter for all participants along agricultural value chains, regardless of gender. The EBA indicators measure the business environment for farmers and agribusinesses in the context of inputs (seed, fertilizer and machinery), finance, markets, transport, information and communication technology (ICT), water and land, and are relevant to the economic and social advancement of those involved in those sectors. Among them, women can benefit from an improved business environment as measured by EBA indicators, through at least four channels, namely: 1) streamlined procedural and operational requirements for businesses; 2) member-based rural institutions; 3) innovation for financial inclusion; and 4) land use and ownership.

Streamlined procedural and operational requirements for businesses

Streamlining the agribusiness environment, lifting cumbersome procedures and minimizing procedural costs and delays can benefit farmers. Nevertheless, the benefits that could accrue to women are particularly significant due to their proportionately higher numbers in the agricultural sector, and the low-quality capital, information and time resources to which they typically have access. EBA markets indicators, for example, measure some of the transaction costs for exporting agricultural goods. Women who wish to export agricultural products will benefit from streamlined procedures to obtain all the necessary documents, such as phytosanitary and quality certificates, in less time and at a lower cost. Minimizing entry requirements such as export licensing and mandatory memberships will also facilitate women’s access to export opportunities. Furthermore, EBA indicators on inputs measure the regulatory constraints for registering new seed varieties, fertilizer products and agricultural tractors. Regulations that ease the burden on importers and dealers can make such inputs more readily available and affordable in remote regions, and thus more accessible to women farmers.

Member-based rural organizations

Rural women can also benefit from and be empowered through member-based organizations such as producer organizations (measured by the markets topic), financial cooperatives (measured by the finance topic) and water users’ associations (measured by the water topic), all of which help their members overcome obstacles relating to access to productive capital (seed, fertilizer, machinery and water), access to markets or access to finance. For example, where laws and regulations facilitate the establishment, operations and capitalization of agricultural sales cooperatives, women can benefit from a regulatory environment that enables them to create, join and take leadership positions in such entities.

Innovation for financial inclusion

Several studies suggest that low financial inclusion rates for women not only constrain agricultural
productivity but also reduce food security, nutrition and education investments. Accessing appropriate finance continues to be a significant challenge for women. For example, in Uganda, although 38% of all registered companies are owned by women, only 9% of credit is accessible to them; and in Kenya, where women own 48% of micro and small enterprises, only 7% of credit is accessible to them. Women generally face legal impediments, discriminatory bank practices and male-favored cultural assumptions that limit their access to suitable financial services. The fact that women usually do not possess assets that could serve as collateral also reduces access to finance, as does the lack of formal credit institutions in rural areas. Microfinance institutions (MFIs) are a crucial alternative to traditional credit providers and banks, and the majority of MFI clients in many regions of the world are women. Financial cooperatives can also provide an alternative to commercial banks. EBA finance indicators encourage the creation of a regulatory environment for MFIs and financial cooperatives, and they analyze the range of assets that banks accept as collateral.

Land use and ownership

Land is one of the most essential elements for agriculture, and therefore any limitations on land use or ownership by women also restrict the economic autonomy of women and compromise agricultural productivity. Less than 20% of agricultural landholders worldwide are women. Insecure land tenure for women discourages financial and physical investments to improve the quality of land for production, and compromises the ability of women to pledge land as collateral to obtain financing. EBA land data measure leasing of land, public land management, procedural safeguards in case of expropriation, gender disaggregation of land records and relevance of land records—implementing good policies and regulatory practices in these indicators can help improve women’s use and access of agricultural land.

What gender-relevant data were collected this year?

The following areas of research were chosen for coverage in EBA 2017: availability of gender-disaggregated data, restrictions on women’s employment and activity, women’s participation and leadership in collective groups and nondiscrimination legal provisions. These questions build on findings from the Women, Business and the Law dataset, which already identifies many relevant constraints.

Availability of gender-disaggregated data

Regulation can ensure banks and MFIs collect gender-disaggregated data by including such requirements in their reporting obligations. In only 6 of the 62 countries studied, however, are commercial banks required to disaggregate their loan portfolio information by gender. The same obligation applies to deposit-taking MFIs in 14 of the 33 countries where MFIs are allowed to take deposits (figure 11.1).

The land topic provides information on the availability of gender-disaggregated data on land ownership across 38 countries. In 18 of those countries, land registries gather gender-disaggregated data for individually and jointly-registered land.

Restrictions to women’s employment and activity

Regulations restricting women’s participation in certain professions actually deny income-generating opportunities to women and shrink the pool of workers that firms can employ. Identifying employment restrictions in the agricultural and agribusiness sector can complement the sectors already identified by the Women, Business and the Law dataset, including construction, factory work, metalworking and mining. EBA collected data on employment restrictions in the context of handling pesticides or fertilizers, driving trucks and using agricultural tractors.

Among the countries surveyed, Kyrgyz Republic and Vietnam both prohibit women from handling fertilizers and operating tractors. Egypt, and the Russian Federation also impose restrictions on handling fertilizer and tractor use, respectively.

Figure 11.1 | Are commercial banks and MFIs required to collect gender-disaggregated data?

Source: EBA database.
Women’s membership and participation in producer organizations

Limitations on the ability of women to become members of organizations such as agricultural cooperatives compromise their ability to capitalize and commercialize their produce, and turn smallholdings into profitable agribusinesses.

Strong laws and regulations stipulate mandatory membership criteria that cooperatives apply to all member applicants, to avoid the development of bylaws that may restrict women’s participation. Membership criteria requiring land ownership or full-time farm employment, or restricting membership to heads of household or to one member per household, have a tendency to limit women’s access to member-based institutions on a de facto basis.19 Of the 62 countries surveyed, only 4 countries (India, Russian Federation, Rwanda and Serbia) require that producer organization membership be limited to one member per household. In Nigeria, cooperative members must have legal ownership over land. On the other hand, a new agricultural cooperative law adopted in Greece in April 2016, now allows women-only cooperatives to be established with only 5 female founding members, compared to regular cooperatives where 20 members are required.

Encouraging women to hold leadership positions in local organizations also plays an important role in...
promoting gender equality. Quotas can establish the necessary critical mass of women as members and leaders to engender change in policy and the institutional culture and lead to more productive, profitable organizations. Eight of the 62 countries surveyed (Greece, India, Kenya, Korea, Nepal, Nicaragua, Rwanda, and Spain) have proactive policies to promote women’s participation in the leadership of such groups (figure 11.2). In most cases, a quota is used and set out in applicable legislation. This is the case in India, where most state cooperative laws have a legally mandated minimum requirement regarding the number of women to be included in cooperative managing committees. Similarly, in Kenya, the 2010 Constitution mandates that no more than two-thirds of the members of elective or appointive bodies, including cooperatives boards, shall be of the same gender.

**Nondiscrimination**

EBA also collected data on whether specific laws on producer organizations, financial cooperatives and water user organizations require them to adhere to principles of nondiscrimination and if gender is specified as a protected category.20

In the laws directly applicable to producer organizations, legal protection against discrimination is provided in 28 of the countries studied. Among those, 22 specifically provide that gender-based discrimination is prohibited (figure 11.3). For example, Mexico’s Law on Cooperatives provides that cooperatives must guarantee equality in rights and duties among members and equality for women. Similarly, Nicaraguan and Bolivian laws establish the principle of gender equality as applicable to cooperative operations. Nicaragua requires cooperatives to promote the integration of women in cooperatives through specific programs and campaigns.

In other countries the constitution contains a nondiscrimination clause. According to the Women, Business and the Law database, 42 countries from the EBA sample have legal protection against discrimination, 28 of which mention gender as a protected category.21

**Conclusion**

As they assess the overall business environment for agriculture and agribusiness, EBA indicators cover a range of regulatory and procedural aspects that have a direct impact on women working as producers and at other levels of the agricultural value chain. New data were collected this year to highlight some areas where regulations can have a more direct impact on women’s productivity and opportunities for advancement. Those areas include the availability of sex-disaggregated data with regard to banking and land transactions, the existence of legal restrictions to women’s employment in agriculture-related activities and the existence of legal obstacles to women’s participation in membership-based organizations such as producer organizations, financial cooperatives and water users’ associations. Progress on these areas as well as across EBA indicators in general can improve women’s prospects and participation in agricultural value chains and ensure that women are on an equal footing with men. It is hoped that through a mix of existing agricultural policies becoming more gender-inclusive, and the designing of new policies that are gender-targeted, constraints will be lifted and the particular needs of women in agriculture will be better met.

15  OECD 2014.
16  UN Women 2016.
18  The Women, Business and the Law indicator, using property, is extremely useful in determining some constraints women face related to land use and ownership. For example, according to this dataset, in about 20% of the EBA sample countries, the law does not give men and women equal inheritance rights.
19  Prakash 2003.
20  A nondiscrimination provision is based on the principle of fairness and equality under the law. It prohibits discrimination in the treatment of members in regardless of gender, profession, income and so on. For instance, it may include language requiring fair terms for women and men when joining as a member or applying for a loan.

REFERENCES

Land
Secure tenure provides incentives for land-attached investments to enhance productivity of land use and discourage unsustainable practices (such as soil mining) that generate negative effects. The definition of land rights and avenues to access it affect equality of opportunity, women’s bargaining power, households’ ability to bear risk and their sense of identity. If land can be transferred and markets are sufficiently liquid and their functioning not impeded by other market imperfections, it is ideal collateral that can allow those previously excluded to access financial markets. However, impediments to land market functioning can undermine the ability to use land as collateral in financial markets and make it more difficult for entrepreneurs, small or large, to access land to develop entrepreneurial activities.2

By allowing the productive use of land by individuals moving out of the agricultural sector, land rentals or sales can contribute to structural transformation. Land records are also indispensable to effectively manage public land in rural areas and to plan and finance urban expansion in a way that is associated with higher density rather than sprawl. Moreover, without well-defined land rights, it is difficult to provide incentives for production of environmental amenities.

Klaus Deininger authored this chapter. What do the land indicators measure?

EBA land indicators measure laws and regulations that impact access to land markets for producers and agribusinesses (table 12.1). The indicators are organized as follows:

Coverage, relevance, and currency of land records: This indicator measures the extent to which relevant and up-to-date documentation of land rights is available for all. A key purpose of land records is to ensure land owners are confident enough about their rights being protected to make long-term investments in agriculture and transfer them to others, if they decide to take up nonagricultural opportunities.

Coverage and ease of use. This sub-indicator measures if land records provide information on ownership and location of land in an integrated fashion. Broad coverage is essential for land records to support access to finance and transferability, and to protect existing rights from an equity point of view. Moreover, to prevent disputes over boundaries or overlaps, and allow use of records for planning, land rights documentation needs to include a clear reproducible description of boundaries together with the written record that is updated in case of transfer or subdivision.

Visibility of restrictions on land records. This sub-indicator assesses the extent to which restrictions relating to a land parcel are evident on the record. Ensuring that all relevant restrictions are visible on the record is key to ensure that, before entering into contractual relationships involving a parcel of land, interested third parties need not conduct time-consuming and costly searches and inquiries. Complete records also reduce conflict and speed up dispute resolution.

State land management: The indicator measures how state-owned land, such as forests, parks, road reserves and other public spaces are identified and thus can be state-owned land, such as forests, parks, road reserves and other public spaces are identified and thus can be protected against encroachment. The issue is particularly acute in low-income settings where laws stipulate that all land not explicitly registered or occupied by private parties—which are often farmlands—belongs to the state.

Record information on state-managed land. This sub-indicator measures whether state land is identified and mapped, and whether a field-based process is put in place before any land is transferred. Failure to have them may render large parts of the population vulnerable to dispossession and affect willingness to invest in the land.

Transfer of state land for commercial use. This sub-indicator measures if regulations governing the transfer of state land for commercial use ensure a transparent process. To ensure that state land is put to its best use, any transfer of state land for commercial purposes (excluding social concerns) should be via public auction. If applicable, development conditions, means of verification, or sanctions for noncompliance should be clearly stipulated with key contractual provisions public and open to independent third-party monitoring.

Equity and fairness: This indicator measures the extent to which gender aspects of land are considered in policy-making, land can be accessed via rental or sales markets, and land rights are protected against expropriation without fair compensation. As a basic asset, equal treatment for different types of land owners or users is important, whether by gender or type of documentation.

Gender-differentiated recording and reporting. This sub-indicator measures regulations on monitoring the gender dimension of land rights to lay out the foundation for identifying the magnitude of this gap and assess if measures to close it are having any effect. Even if gender equality is guaranteed constitutionally, the extent to which such principles are translated into practice may be lagging.

Freedom of leasing. This sub-indicator focuses on regulations and restrictions on leasing. While the fact that land also provides an important social safety net may lead communities to restrict the ability to permanently transfer land, leasing is critical for structural transformation and restrictions on its use may not only drive many efficiency-enhancing land transactions underground, enhancing insecurity for lessors (often single women), but also restricting the scope for more effective land use.

Procedural safeguards in case of expropriation. This sub-indicator measures regulations to ensure that expropriation is limited to public purpose, implemented transparently and with effective appeals mechanisms. While provision of infrastructure and reallocation of agricultural land for industry and urban expansion can provide significant social benefits, having to fear land being expropriated without adequate compensation or due process can undermine investment incentives, lead to over-acquisition of land from a social point of view, and precipitate conflict. Often, expropriation threats imply that peri-urban land is not used for high value crops as in China or Nigeria.

How do countries perform on the land indicators?

Overall scores for the 38 countries in the EBA land sample point towards wide variation in performance across countries (figure 12.1). OECD countries rank highest, followed by Europe and Central Asia where large sums were invested in land administration.

infrastructure over the last decade. Although scores are lowest for Sub-Saharan Africa, strengthening the regulatory environment for land governance can lead to considerable gains also in other regions such as South and East Asia or Latin America.

Figure 12.2 displays the scores for the three land sub-indicators by income group. With the possible exception of upper-middle-income countries, scores are lowest for management of state land, suggesting that, in the short term, improved mapping and demarcation together with processes for transferring state land for commercial use that are more transparent and rely on independent monitoring offer opportunities for significant gains. Given the increased scrutiny of supply chain governance by private sector institutions, especially financiers, such measures could provide opportunities to attract investment into the sector.

While low-income countries score reasonably well on equity and inclusion, they differ markedly from the rest in terms of coverage, quality and relevance of records. Recent technological improvements in IT and earth observation provide a basis for rapid improvement and leapfrogging in this area, ideally followed by state land registration.

**Coverage, relevance and currency of records for private land**

Data from the Doing Business land administration quality indicator point towards a considerable difference in coverage of land records, which is lowest for agricultural land in most countries. Figure 12.3 shows that, conditional on coverage, digitization of textual and spatial records can have high returns, especially for low-income countries. Less than 20% of sample countries in the low-income category have textual and spatial records digitized, limiting the scope for land data integration.

In many of the countries where coverage with digital records is low, paper records may either be outdated or overlap with each other, in which case they may provide little tenure security. In high-potential agricultural areas or urban settings, record digitization should be prioritized and combined with rigorous quality checking and, in case there are issues, a participatory low-cost process of systematic registration to update records and expand coverage, following the example of Rwanda. In rural areas with lower levels of agricultural potential, limited market activity and communal governance structures that are still functional, registration of individual plots may be neither desirable nor cost effective. Recording of community boundaries together with clarifying internal management structures and modalities for recording of land rights and transfers, may bring social and economic benefits by securing rights, providing the basis for negotiation with outsiders and allowing a transition towards more sophisticated systems as and when the need arises.

All the top performing countries have digitized and integrated textual records and cadastral maps as well as
mechanisms to ensure that material changes in rights are recorded, be it transfer of ownership via sale or inheritance or creation of a link to ensure that mortgages or a civil dispute involving a specific land parcel is automatically reflected in the registry. Alerting third parties of such changes minimizes the potential for fraud and obviates the need for costly and socially wasteful examination of rights by each party.

**State land management**

Key indicators of the state land management quality (Figure 12.4) point towards a considerable gap between high- and upper-middle-income countries and the rest in terms of the share of state land that is registered and mapped and the extent to which such records are publicly available. While all of the former have most of their state land mapped and most of them have such rights registered and maps publicly available, this is the case only for less than 20% of the lower-middle and low-income countries in the sample.

Similarly, stark differences emerge for the extent to which state land transfers are by public tender, key contract provisions are publicly available and compliance is monitored. Differences along these dimensions are likely to not only reduce prices received by the public but also land use efficiency on land subject to such transfers. It may also jeopardize countries’ ability to attract investment by investors whose supply chains are subject to scrutiny either from customers or financiers.

**Equity and inclusion**

Figure 12.5 displays information on values for three key sub-scores under the equity and fairness sub-indicator, namely: (i) if there is gender-differentiated monitoring of land rights; (ii) whether registered and unregistered land are compensated equally (or all land is registered so that the question does not arise); and (iii) the expropriation process and, in particular, associated valuations can be contested.

Data suggest that in the low-income countries in the EBA 2017 sample, the scope of receiving compensation for unregistered land that is equal to what would be received for registered land is much lower, despite the fact that in such countries most land remains unregistered, the scope for market-based transfers for land acquisition is more limited and regulations often require expropriation of land to transfer it to investors. Although a higher share of low- and lower-middle-income countries allows appeals against valuations, there is little administrative support for such appeals to be successful.

With economic development and expansion of opportunities for nonagricultural employment, opportunities for (long-term) land leasing will be important to ensure that rural areas allow (young) farmers with higher skills to expand and invest in more capital-intensive production methods. Leasing is also an important way for women to access land. Regulatory barriers to leasing or the high cost of entering into/registering
such transfers may prevent these transactions from happening. The incidence of leasing restrictions has been reduced and many countries report availability of standard leases to reduce the transaction cost of engaging in such transactions. Still, some changes go in the other direction; for example, Ukraine imposed a seven-year minimum duration for any lease to be registered. The ensuing immediate and massive drop in the number of registered leases, from more than 140,000 to some 30,000 per month, illustrates that regulation can set important repercussions.

What are the regulatory good practices?

Good practice examples for each of the main areas of emphasis are provided in box 12.1 and some cases are described in more detail below.

Registration of land rights and computerization of land registry information

Land tenure regularization in Rwanda illustrates the scope for combining modern technology and participatory processes and the multiple benefits form land registries. Following passage of the 2004/5 land policy and organic land law, a three-year pilot in 2007-10 on some 15,000 parcels helped design locally implementable low cost and participatory processes. This helped double the rate of investment in soil conservation while tripling it for female-headed households who suffered from higher insecurity. Land rights by legally married women improved, although those without marriage certificate were negatively affected, an issue corrected before the national roll-out. The refined process led to demarcation and registration of the country’s 11.5 million parcels in less than three years at US$ 6 per parcel, improving investments in land and tree planting, females’ tenure security and functioning of land rental markets. The registry can be accessed online by Banks or local staff (via mobile phones) and viewed by investors; potential increments in urban residential land tax revenue due to having a complete register alone are more than sufficient to recoup the program cost in less than a decade.

Focusing on communities allowed Mexico to regularize more than 60 mn. hectares in slightly more than a decade. A first step involved recognizing communities’ legal personality and establishing mechanisms for internal self-governance (general assembly, executive, and an oversight committee). Once approved by the assembly, land registration then involved officials working with members to identify plot owners, resolving pending disputes in specifically created courts, and creating a map with boundaries of individual or communal plots for approval by the assembly that triggered issuance of certificates to all rights-holders. It enhanced productivity, investment, economic and migration opportunities, especially for those with weak rights or lower endowments.

Sequential computerization of land registration in the Indian state of Andhra Pradesh helped to make information on land rights accessible and thus increased mortgages by 18% and credit volume by 10.5%.

Public land management in Peru and Brazil

Peru shows that transparent public state land auctions can enhance transparency and efficiency of land use. Once the auction is initiated, the intention to divest the land and the terms of the bidding are published for at least 90 days. Bidders must prequalify by posting a bond of at least 60% of the minimum bid price plus intended investment. Auctions of 235,500 hectares brought almost $50 million in investment to Peru’s coastal regions over the last 15 years, generating large numbers of jobs and underpinning the country’s emergence as a major force in high-value agro-exports.

To limit deforestation due to area expansion, Brazil’s Forest code long required that, in environmentally sensitive areas, a certain share of each property be kept under forest, though impact remained limited to weak enforcement. A shift to satellite-based monitoring of land use changes together with local enforcement in 2004 was, in 2008, complemented with a decision to make preferential credit access conditional on demonstrated compliance with environmental norms. In 2005-09, this is estimated to have helped avoid 73,000 km² of deforestation. In Brazil’s Para state, use of such information by the private sector drove adoption of the environmental cadaster and further reductions in deforestation. As a result, a tripling of the Amazon’s cattle herd and a six-fold increase of area planted to soy since 1990 was associated with a decline in deforestation to about one third of the 1990 level, effectively decoupling soy and beef production and deforestation.

Equity and inclusion through gender recording standard leases and regulations on expropriation

While Vietnam’s 1993 Land Law made rights more secure by introducing Certificates to allow farmers to trade, transfer, rent, bequeath or mortgage land use rights with positive economic impact, women were often left out partly because of the nature of the forms. Regulation requiring two spaces implied that, by 2015, more than 70% of certificates were issued jointly, overcoming gender discrimination and improving women’s bargaining power and educational attainment of their children.

Many Indian states historically imposed rent ceilings or outlawed leasing. But instead of benefit them as intended, this is driving tenants—often poor women—underground, making them more vulnerable, reducing productivity and investment and causing owners to leave large tracts of land idle. To address this, Government drafted model legislation and contracts that are being considered for implementation in several Indian states.

Widespread past abuses of expropriation for political purposes led Peru to impose constitutional rules to limit expropriation to tightly defined public purpose. New regulations introduced to implement the rules require Congressional authorization for any expropriation and voiding it if the state is not the direct beneficiary or if land has not been transferred to the intended use within 24 months so that land reverts back to the original owner.

What are other areas of research?

Group rights: As a cost-effective way to cover large areas, group rights have long played a role to protect right to indigenous areas and significantly contribute to conserving natural resources. Pilots all over the world to demarcate communal rights in a comprehensive participatory way are currently underway and the main issue is the extent to which results from such initiatives enjoy legal recognition. In fact, if regulations and laws are fashioned appropriately, there is scope for expanding such approaches to support comprehensive and cost-effective demarcation of the outer boundary of villages. If linked to adoption of clear approaches to within-group governance, this could be linked to mechanisms for internal management of rights to individual agricultural or house plots and avenues for greater formalization if and when the need arises. A highly policy relevant approach would be to identify the cost, in terms of time and motion, of acquiring a document to certify group rights on a demand-driven basis.

Cost of conducting a survey: High survey standards and anachronistic requirements open the door to discretion and increase the cost of conducting surveys, and constrains the scope for registry expansion and currency as it drives transactions underground. To address this, professionals have long recommended a “fit for purpose” approach to surveying as a measure that could provide enormous benefits, to improve coverage and reduce informality. Working with professional associations to establish benchmarks that can then be pilot tested in a range of countries would have a high return and allow to address a key bottleneck.

Linking to national parameters: All the three indicator groups include elements that relate to national systems and are easy to assess. Doing so through the Doing Business registering property indicator, to be complemented with more specific assessment of aspects related to the agricultural sector, will greatly strengthen the ability to use EBA results for global comparison and in relevant policy dialogues.
The above discussion suggests that ways to make quick improvements differ somewhat between countries in the high- and low-income groups. The former can score quick wins by ensuring integration of textual and spatial elements of land records, making these available to economic actors and other government departments, ensuring that an appropriate regulatory framework allows different actors to harness benefits from this infrastructure, and closely monitor elements of its expansion, including the gender dimension.

By comparison, for most low- and lower-middle-income countries, enormous short-term advances can be made by improving the regulatory framework and associated records for managing public land, ensuring equal treatment of women as well as owners of registered and non-registered land, and from moving existing land records to a digital platform to identify issues that need to be addressed to ensure transparency and explore opportunities for expansion in high potential areas to protect existing right holders, allow them to transfer their land to higher uses as appropriate, and provide investment incentives. Based on digitization of existing records and review of the regulatory framework, approaches to enhance coverage in a participatory and low-cost way can then be identified and carefully piloted, with the scope for larger roll-out in the medium term.

Livestock
Livestock is one of the fastest-growing agricultural sub-sectors in the world, accounting for around 40% of agricultural output in the developing world. The term of livestock is used in this report to refer to domestic or domesticated animals that are raised mainly for agriculture purposes and includes, for example, large ruminants such as cattle, small ruminants such as goats, as well as pigs and poultry. Aquaculture is not considered by the livestock topic.

Livestock is a main source of income for one in five people across the globe. Livestock infectious diseases, therefore, pose a significant risk to that contribution if left unchecked. Estimates suggest that these diseases are responsible for more than 20% of livestock production losses globally. Furthermore, approximately 70% of all new human diseases are zoonotic, transferring between animals and humans, and mostly originating from animals.

Maintaining animal health is thus central to the global food system’s stability and safety. Readily available preventative and curative veterinary medicinal products (VMPs) can minimize the negative economic impact of diseases and safeguard the livelihoods of millions of farmers around the world. However, VMPs (biologics and pharmaceuticals) have to be used in the correct circumstances and in accordance with prescribed conditions and dosages if they are to be truly effective. If not, for example, their use can lead to increased drug resistance and illness in humans due to drug residues in consumed animal foods. Further, open borders, inadequate legal frameworks and poor law enforcement can lead to counterfeit and substandard VMPs in the market.

Today Johnson is a successful cattle farmer in Garissa in northeastern Kenya. He started his business in 2006, but it almost did not make it. In 2006 Kenya and its neighbors, Somalia and Tanzania, experienced an outbreak of the Rift Valley Fever disease—an infectious animal disease that can also be transferred to humans. Johnson lost a significant number of his cattle herd. He was not alone in experiencing the destructive impact of the disease outbreak. By the end of the outbreak in 2007, the economic loss in Kenya was estimated to have been greater than US$9.3 million, due to the ban on livestock trade and the forced quarantine of animals. Thankfully, the disease was contained within a year; Johnson purchased more cattle and was able to continue with his business.

Comprehensive regulations on the manufacture, registration, import, distribution, sale and/or administration of livestock medicinal products can contribute to establishing a reliable market supply of effective and safe VMPs. Since research and development in the veterinary medicine sector is expensive, specialized and time consuming, most manufacturing facilities are established and owned by large companies located in specific regions of the world. While large companies represent the bigger market share of VMP manufacturing, a diversified mix of private sector entities supply the market—large companies, small and medium enterprises (SMEs), breeders’ organizations, and veterinarians. Given this dominant role of private sector in the development, manufacturing and market supply of VMPs, it is important that regulations are streamlined and efficient in order not to discourage them from entering and operating in markets.

Access to effective and safe VMPs is just one critical input into livestock production. Other key production inputs are feed resources, productive animal breeds and veterinary services. While the focus of the livestock topic in EBA17 is on VMPs, the topic will be further developed in the coming years to assess the impact of regulations on other relevant issues in livestock production. Once a more comprehensive data set is established, an adequate livestock scoring methodology will be developed and implemented.

**What does the veterinary medicinal products topic cover?**

The data collected cover regulations impacting the private sector’s ability to supply the market with effective and safe VMPs. Data assess regulatory requirements for registration, importation and marketing of VMPs:

**Registration of VMPs:** Registration, or marketing authorization, is a critical step in a country’s control system for VMPs. Most countries require VMP registration before it can be manufactured, imported, distributed and sold. Data were collected on:

**Institutional structure.** Literature suggests that a country’s ability to provide effective regulatory institutions is an important determinant of how well markets function. Having multiple government institutions involved in the registration process can create a burden for the private sector, especially when roles and responsibilities are not clearly defined and the applicants are required to interact with multiple different institutions.

**Registration process.** Data points assess the existence of obstacles and good practices during the registration process. Unclear and irrelevant registration requirements often lead to delays in the registration process and create severe registration backlogs of products awaiting marketing authorization. In addition, the private sector’s knowledge of and trust in the registration process influence the decision to supply markets with VMPs and whether to participate in the legally mandated registration process.

**Registration output.** The registration system can produce a registry of authorized VMPs and temporarily protect proprietary data submitted during the registration process for newly developed products. The registry’s existence has legal consequences, given that most countries require that products must be registered prior to market entry and circulation. Time-bound proprietary data provides incentives for innovation and research and development. Unlike human medicinal products, the financial return for VMPs can be significantly less, given the lower sales prices and potentially smaller market size, especially for the market for small animals.

**Authorization of importers:** In many countries, the main supply of VMPs comes from outside the country and import licenses are a useful way to impose minimum safety and qualification requirements on the companies involved. The data collected cover import restrictions such as types of entities allowed to import VMPs and whether importers are required to employ specialized staff.

**Marketing of VMPs:** Labeling requirements on marketed VMPs are critical to ensuring their proper handling and administration. In addition, knowing what diseases are present in a country, their geographic location and the size of the livestock populations threatened are all key factors in determining resource mobilization of VMPs. In particular, data assess:

**Labeling of marketed VMPs.** VMPs are often administered by veterinarians and farmers; as such, adequate labeling is of paramount importance.

**Information availability on animal diseases.** The private sector can use information in a national disease database, beyond data available on transboundary diseases and zoonosis (diseases transferable from animals to humans) found in World Organization for Animal Health (OIE) and regional databases, to make distribution and sales decisions and to explore new market niches.

Some good practice examples are showcased in box 13.1.

Some good practice examples are showcased in box 13.1.
Some insights emerging from the data

Ensuring the predictability of registration systems for VMPs

The VMP registration system’s predictability influences private sector decisions to supply a market with VMPs using the legally mandated process. Ease in accessing information on registration requirements and the VMP registry, confidence that all necessary documentation are included in the application package (dossier) and awareness of the timeframe by which the registration is intended be completed, are all factors that can contribute to the predictability of the registration process.

It is vital that applicants are aware of all the registration requirements and are able to easily obtain such information. Of the 59 countries legally requiring VMP registration, 5 countries do not provide information on dossier requirements on the website of the authority mandated to register VMPs (Haiti, Malawi, Rwanda, Sri Lanka and Tajikistan). In Rwanda, the registration process is yet to start. In Haiti (currently not registering products), Sri Lanka and Tajikistan, documentation specifying dossier requirements is not on the website of the relevant authority. In Malawi, there is no functioning publicly accessible website. The three EBA countries not requiring VMP registration do not have a legal framework and are either in the process of developing a framework or are yet to commence the process (Burundi, Lao PDR and Mozambique).

Given the requirement to register products prior to market introduction and circulation, it is also important that an applicant is able to easily access information on products already authorized for market circulation in a country. Of the 57 countries actively registering VMPs, a registry is available online in 37 countries, 21 of which are high-income or upper-middle-income countries. Only 12 lower-middle-income countries and 4 low-income countries provide a registry on the registering authority’s website.

In most countries, during the dossier evaluation process, each time the regulatory authority requires additional information from an applicant, the registration process is put on a hold. To limit this outcome, the application package (dossier) can be checked for completeness prior to the start of evaluation. Sixteen EBA sample countries indicate either in a legally-binding
document or in a non-legally binding guideline, that dossiers will be checked for completeness. In Mexico, for example, the 2012 Regulation of the Federal Law on Animal Health (a legally binding document) explicitly addresses issues concerning the checking of dossiers for completeness. Another example is Armenia, which does not directly state such requirement in a legal document, but rather indicates the checking for completeness in non-legally binding registration guidelines from the authority. In addition, these countries also provide timeframes within which the applicant can be contacted for missing documents prior to the start of evaluation. These timeframes range from 3 days in the Kyrgyz Republic to 60 days in Bosnia and Herzegovina.

The awareness of how long the registration process can take allows the private sector to plan the market introduction of products accordingly. The expected registration times are an estimation by regulatory authorities of how long the process can take based upon the registration process adopted in a country. Some countries implement a detailed registration complete with the testing of products, while others may rely on the use of reference countries and other parameters, thus sometimes explaining the shorter expected registration time. Thirty-eight countries currently provide a time limit for the registration process in a legally binding document or a non-legally binding guideline. The time limit ranges from 30 days (Cambodia) to 365 days (Jordan and Kenya) for biologicals and pharmaceuticals.

Adhering to the expected registration time limit can be challenging in some countries. In comparing the timeframe between the expected and actual registration time, regulators could potentially use the difference to assess the efficiency and quality of the registration process. In addition, the difference could be used by applicants to hold the regulatory authority accountable.

**Safeguarding animal and human health by comprehensively labeling VMPs sold**

Labeling requirements help to ensure that drugs are properly used. The legal requirement can provide information on the characteristics of the product, such as the list of active substances per dosage or weight, the proper handling and storage conditions for the product, the proper use of the product and route of administration and information to ensure consumer protection such as the withdrawal period. The withdrawal period is the time between the last administration of medicine to the animal and the production and marketing of animal foods for consumption. Following appropriate withdrawal periods for VMPs reduces the risks to human health associated with drug residues in products such as meat, milk, eggs and honey. Only 27 out of the 60 countries studied require that withdrawal periods are included on the labeling of VMPs (figure 13.1). This number includes all high-income countries and the majority of upper-middle-income countries. Only 2 out of 16 low-income countries, or 13% of this income group, have this requirement.
Facilitating the market distribution of VMPs using national animal disease information systems

The outbreak of animal diseases directly impacts animal and human health. Therefore, it is important for countries to have a functioning animal disease surveillance and information system in place to mitigate the risk of disease outbreaks. One important dimension of such a system is the existence of national databases that can be used to monitor and track local outbreaks. Sophisticated systems follow not only those diseases that are required to be notified to the World Organization for Animal Health (principally diseases that impact trade and are transboundary), but also diseases that may be endemic to a local livestock population. National disease databases can be provided and maintained by national veterinary authorities and include information on when a disease was identified, its geographic distribution and spread. The private sector can then use such databases to make distribution decisions and understand the potential size of the market for a VMP.

EBA data suggest that lower-middle and low-income countries have serious gaps in terms of animal disease information systems that are publicly accessible online. At the regional level, Sub-Saharan Africa has the fewest countries with animal disease databases publicly available on the responsible authority’s website. None of the 21 Sub-Saharan African countries studied have an animal disease database available online.

The situation is also similar in South Asia, where only Nepal has an electronically accessible database.

Conclusion

The level of transparency, predictability and efficiency of relevant regulatory systems is critical to private sector decisions to supply a market with VMPs, and thus can affect the availability of effective and safe VMPs in the market. While capacity and systems to control VMPs may vary in countries, it is vital that information needed to adhere to regulatory requirements is readily available and that the processes do not delay nor discourage market supply. It is also equally important that there is adequate infrastructure to assess the effectiveness and safety of VMPs, and effective mechanisms to ensure both animal and human safety in the context of VMP use.

REFERENCES

Enabling the Business of Agriculture 2017 (EBA 2017) presents indicators and data that measure regulations that affect the business in and around agriculture. In the project’s third year, the team collected data in 62 countries in the following 12 topic areas: seed, fertilizer, machinery, finance, markets, transport, water, information and communication technology (ICT), land, environmental sustainability, gender, and livestock. Eight of the topics were scored this year and are presented below. The other four will be expanded, refined and potentially scored in future years.

EBA Methodology

EBA 2017 data are collected in a standardized way. The team designs questionnaires for each topic area and administers them to experts in each country. The questionnaires use a hypothetical, standardized case scenario to ensure comparability across countries. The standard business case with assumptions about the legal form of the business, its size, its location and the nature of its operations for each topic applied for all countries. Assumptions guiding respondents through their completion of the survey questionnaires vary by topic and are presented in more detail in appendix B. In addition, in the interest of comparability, the values in the assumptions are not fixed values but proportional to the country’s gross national income (GNI) per capita.

Once the data are collected and analyzed, several follow-up rounds address and resolve any discrepancies in the answers the respondents provide, including through conference calls, written correspondence and country visits. For the EBA 2017 data collection, the team traveled to 14 countries to verify data and recruit respondents. The data in this report are current as of June 30, 2016.

Legal indicators

Legal indicators emerge from a reading of the laws and regulations. In a few instances, the data also include some elements which are not in the text of the law but relate to implementing a good regulatory practice—for example, the online availability of a fertilizer catalogue. The team identified good regulatory practices for each topic area. The individual questions or regulatory dimension are assigned numerical scores ranging from 0 to 1 (see topic data notes, below, for details). The scores of the different indicators within one topic are also averaged into a topic score.

Efficiency indicators

Efficiency indicators reflect the efficiency of the regulatory system—for example, the number of procedures and the time and cost to complete a process such as certifying seed for sale in the domestic market. Data of this type are built on legal requirements, and the cost measures are backed by official fee schedules, when available. Time estimates often involve an element of judgment by respondents who routinely administer the relevant regulations or undertake the relevant transactions. To construct the time estimates for a particular regulatory process, such as completing the requirements to import fertilizer, the process is broken down into clearly defined steps and procedures. The time to complete these steps is verified with expert
respondents—through conference calls, written correspondence and visits by the team—until there is convergence on a final answer. The specific rules followed by each topic on defining procedures, time and cost estimates are described below.

**Distance-to-Frontier and Topic Rankings**

**About distance-to-frontier score**

*EBA 2017* presents two aggregate measures per topic: (i) the distance-to-frontier scores and (ii) the topic rankings that results from ordering distance-to-frontier scores.

The distance-to-frontier score benchmarks economies with respect to regulatory best practice in each topic, showing the absolute distance to the best performance on each EBA indicator.

The distance-to-frontier score captures the gap between a country’s performance and a measure of best practice across the entire sample of 27 indicators for eight EBA topics (land, environmental sustainability, livestock and gender indicators are excluded). For transport, for example, the Russian Federation has the shortest time (1 day) to obtain a cross-border license required for domestic trucks in the partner country; Denmark has the highest number of regulatory good practices in terms of trucking licenses and operations (10.8 out of 11).

The complete list of indicators is presented in table A1, below. EBA indicators are divided into legal and efficiency indicators. In efficiency indicators, the time, cost and documents required to conduct a specific administrative procedure (such as the registration of a new fertilizer product) are combined to build a single indicator.

**Calculation of the topic distance-to-frontier score**

Calculating the topic’s distance-to-frontier score for each country involves two main steps. In the first step individual component indicators are normalized to a common unit where each of the 27 component indicators is rescaled using the linear transformation \((\text{worst} - y)/(\text{worst} - \text{frontier})\). In this formulation the frontier represents the best performance on the indicator across all countries. The best performance and the worst performance are established based on the data collected as of June 2016. For legal indicators such as branchless banking indicator in the finance topic, or the plant protection indicator in the markets topic, the frontier score is set at the highest possible value and the worst performance corresponds to the worst possible score. For efficiency indicators, a score of 0 is assigned in cases of “No practice” and “N/A” (see topic data notes).

To mitigate the effects of extreme outliers in the distributions of the rescaled data for efficiency indicators (for example, very few economies need more than 954 days to complete the procedures to register a fertilizer product), the worst performance is calculated after the removal of outliers. The definition of outliers is based on the distribution for each component indicator. To simplify the process two rules were defined: the 95th percentile is used for the indicators with the most dispersed distributions (including the time and cost indicators), and the 99th percentile is used for the number of documents (for example, the number of documents required to export agricultural products). No outlier is removed for legal indicators scores (such as seed quality control and assurance, tractor testing and standards, or producer organizations).

In the second step for calculating the distance-to-frontier score, the scores obtained for individual indicators for each country are aggregated through simple averaging into one distance-to-frontier score for each topic: fertilizer, seed, machinery, finance, markets, transport, water, and ICT. *EBA 2017* uses the simplest method: it gives equal weight to each of the topic components or indicators. The only exception are efficiency indicators, where the distances to frontier associated with the time, cost and documents are combined and averaged to build a single efficiency indicator. In the area of registration of a new seed variety, the team has made sure that countries are not penalized by their geographical conditions, and different distance-to-frontier scores are established for countries with one or two cropping seasons.

If no data could be obtained for a specific data point, such data point was excluded from the corresponding DTF indicator score in that country. If more than half of the data points could not be obtained for a particular legal or efficiency indicator, that indicator was excluded from the calculation of the DTF topic score in that country.

A country’s distance-to-frontier score is indicated on a scale from 0 to 100, where 0 represents the worst performance and 100 the frontier. The difference between a country’s distance-to-frontier score in 2016 and future score will illustrate the extent to which the country has closed the gap to the regulatory frontier over time. And in any given year the score measures how far a country is from the best performance at that time.

The report team welcomes feedback on the methodology. All the data and sources are publicly available at http://eba.worldbank.org.
Seed

The seed indicators aim to identify obstacles affecting the timely release and production of high-quality seed by the formal seed supply system, by examining the regulatory environment for plant breeding, registration of new varieties and seed quality control.

Three indicators have been developed:
1. Plant breeding.
2. Variety registration.
3. Seed quality control.

The seed topic has four types of respondents: (i) seed producers and seed companies; (ii) national and regional seed associations; (iii) government authorities (for example, the Ministry of Agriculture); and (iv) academics. The data are collected through surveys sent to contributors from Washington, DC, and completed with calls, emails and interviews that are conducted with respondents during country visits. Responses from contributors are crosschecked by reviewing the applicable laws and regulations. Desk research and literature review are also performed to verify certain data points.

To make the data comparable across countries, several assumptions about the new variety to be registered are used. Furthermore, only certain procedures are captured by EBA data, and specific rules are used to calculate time and cost. More detail on each issue, including the scoring methodology for each data point (table B.1) and specific terms, is set out below.

Assumptions about the variety

The variety:
• Is a maize variety developed by the private sector.
• Is being registered for the first time in the entire country.
• Has not been registered in any other country.

Note: In exceptional cases when maize varieties are not being developed by the private sector in the country, we consider imported maize variety, which may have been previously registered elsewhere.

Procedures
A procedure is defined as any interaction of the seed company’s owner, manager or employees with external parties, including any relevant government agencies, lawyers, committees, public and private inspectors and technical experts. All procedures are counted that are legally or in practice required for the seed company to release a new variety of seed. Procedures are consecutive but can be simultaneous.

Time
Time is recorded in calendar days and captures the median duration of each procedure. The time span for each procedure starts with the first filing of the application or demand, and ends once the last procedure required to release a new seed variety on the market has been fulfilled, such as the listing in the national catalog or gazette. Any tests performed by the seed company prior to filling an application are not counted. The minimum time for each procedure is one day. The calendar days for distinctiveness, uniformity and stability (DUS) and value for cultivation and use (VCU) tests are determined based on the number of testing seasons required by the authority and the number of cropping seasons existing in the country, as follows:

Countries with two cropping seasons per year:
• If one season is required by law to perform the tests, 135 days are counted for the testing procedure.
• If two seasons are required by law to perform the tests, 275 days are counted for the testing procedure. This accounts for the two seasons of 135 days each and 5 days to account for the time needed to plow and prepare the land before the next cropping season (135 + 135 + 5 = 275 days).

Countries with one cropping season per year:
• If one season is required by law to perform the tests, 182 days are counted for the testing procedure.
• If two seasons are required by law to perform the tests, 547 days are counted for the testing procedure. This accounts for the full calendar year including one season (365 days) and an additional testing season (182 days).

Cost
Only official costs are recorded, including fees and taxes. In the absence of fee schedules, a government officer’s estimate is taken as an official source. In the absence of government officer’s estimate, estimates by seed companies are used. If several seed companies provide different estimates, the median reported value is applied. Professional fees (for example, notary fees)
are only included if the company is required to use such services. All costs are recorded as a percentage of the country’s income per capita.

**Specific terms**

Basic/foundation seed has been produced under the responsibility of the maintainer according to the generally accepted practices for the maintenance of the variety and is intended for the production of certified seed. Basic or foundation seed must conform to the appropriate conditions set by regulations, and the fulfillment of these conditions must be confirmed by an official examination.

Breeder/pre-basic seed is directly controlled by the originating or sponsor plant breeding institution, firm or individual, and is the source for the production of seed of certified classes.

**Distinctiveness, Uniformity and Stability (DUS) testing** is performed to compare candidate varieties for registration with varieties already listed in seed register, on these qualities:

- **Distinctness** (UPOV definition): A variety shall be deemed distinct if it is clearly distinguishable in at least one character from any other variety whose existence is a matter of common knowledge at the time of filing the application for registration.

- **Uniformity** (UPOV definition): A variety shall be deemed to be uniform if, subject to the variation that may be expected from the particular features of its propagation, it is sufficiently uniform in its relevant characteristics.

- **Stability** (UPOV definition): A variety shall be deemed stable if its relevant characteristics remain unchanged after repeated propagation by the method that is normally used for the particular variety.

**Post-control tests** are performed to ensure that the variety is true to its varietal identity and that the plants must conform to the characteristics of the variety listed by the national catalog at the time of its registration.

**Seed certification** (Organisation for Economic Co-operation and Development [OECD] definition) is the quality assurance process during which seed intended for domestic or international markets is controlled and inspected by official sources to guarantee consistent high quality for consumers.

**Traceability** is the ability to document the history of the origin, production, participants and handling steps involved in the seed production.

**UPOV** is the International Union for the Protection of New Varieties of Plants, an intergovernmental organization based in Geneva, Switzerland. Its mission is to provide and promote an effective system of plant variety protection, with the aim of encouraging the development of new varieties of plants for the benefit of society. To be a member, the law of a country must conform to the standards of the 1991 Act of the UPOV Convention. The country can also have an observer status after having officially expressed an interest in becoming a UPOV member and in participating to the sessions of the Council. To date, 74 states have member status and 57 states have observer status.

**Value for Cultivation and Use (VCU) testing** is performed to assess whether a variety has characteristics and properties that affect improvement in the cultivation or in the utilization of the harvest or its products in comparison to the existing listed varieties.

**Variety** (UPOV definition) is a plant grouping within a single botanical taxon of the lowest known rank, which, irrespective of whether the conditions for the grant of a breeder’s right are fully met, can be:

- Defined by the expression of the characteristics resulting from a given genotype or combination of genotypes;
- Distinguished from any other plant grouping by the expression of at least one of the said characteristics; and
- Considered as a unit with regard to its suitability for being propagated unchanged.

**Variety catalog** is a list of varieties that have been registered and released by a national authority and can be produced and marketed in a country or region as certified seed.

**Variety release committee (VRC)** decides whether a new variety can be registered and introduced on the domestic market.

**Note:** In addition to the initial consultations with seed experts, the team received technical support from Joseph Cortes and Adelaida Harries. The World Seed Project, which is a combined effort from the OECD Seed Scheme, the Food and Agriculture Organization (FAO), International Seed Testing Association (ISTA), ISF (International Seed Federation) and UPOV, also provided technical expertise for the development of the indicator methodology.

### Fertilizer

The fertilizer indicators measure regulatory bottle-necks limiting access to fertilizer. The indicators also focus on operational and economic constraints, as well as the implementation of legislation affecting the fertilizer industry.
Three indicators have been developed, as follows:
1. Fertilizer registration.
2. Importing and distributing fertilizer.
3. Quality control of fertilizer.

The fertilizer topic area has three main types of respondents: i) fertilizer companies, ii) relevant government authorities (for example, the ministry of agriculture), and iii) agricultural input dealer associations. The questionnaire targets all three groups of respondents, whereby the time and motion component is typically answered by the private sector. Data was collected through face-to-face, by phone, or email interviews with respondents.

To make the data comparable across countries, several assumptions about the company and the fertilizer product are used. Furthermore, only certain procedures are captured by EBA data, and specific rules are used to calculate time and cost. More detail on each issue, including the scoring methodology for each data point (table B.2) and specific terms, is set out below.

Assumptions about the fertilizer company
The fertilizer company:
• Is a private entity (company, a nongovernmental organization [NGO] and/or a farmer organization or cooperative);
• Is registered in the country;
• Imports fertilizer to sell in the country;
• Has registered at least one new fertilizer product in the country.

Assumptions about the registered fertilizer
The fertilizer:
• Is a new chemical fertilizer product—a fertilizer product is any product containing nitrogen, phosphorus, potassium or any recognized plant nutrient element or compound that is used for its plant nutrient content.
• Is produced in a foreign country.
• Is being registered for marketing purposes.

Procedures
A procedure is defined as any interaction of the company’s owners, managers or employees with external parties, for example, government agencies, lawyers, auditors, notaries and customs or border authorities. It includes all procedures that are officially required for the business to legally perform its described activities, such as registering and importing fertilizer. Interactions among owners, managers and employees are not counted as procedures.

Time
Time is recorded in calendar days and captures the median duration of each procedure. The time span for each procedure starts with the first filing of the application or demand, and ends once the company has received the final document, such as the fertilizer registration certificate. It is assumed that the company’s owners, managers or employees have had no prior contact with any of the officials.

Cost
The cost captures official fees and taxes associated with the relevant licenses, permits and certificates, along with their required documents. All costs are recorded as a percentage of the country’s income per capita.

Specific terms
Fertilizer registration is the process of registering a fertilizer product or blend with the public sector, during which fertilizer intended for markets is controlled and inspected by official sources to guarantee consistent high quality and safety for consumers.

Fertilizer product is any product containing nitrogen, phosphorus, potassium, or any recognized plant nutrient element or compound that is used for its plant nutrient content.

Importer registration is a government-issued license authorizing a company to import. The import registration is not to be confused with a sales license, which authorizes the company to sell fertilizer.

Import permit is a document issued by a government agency authorizing the importation of fertilizer products into its territory. An import permit can either be a blank permit with no restrictions, or impose volume, shipment or time limits.

Machinery
The machinery indicators measure regulatory barriers and associated practices limiting access and use of agricultural tractors by farmers. In particular, the indicators capture the requirements for tractor import, registration and inspection, tractor testing, the prevailing approval process, as well as tractor performance and operator safety standards.

The following three indicators were developed:
1. Tractor imports.
2. Tractor operation.
3. Tractor testing and standards.

The machinery topic area has five types of respondents, namely: i) tractor companies (tractor manufacturers, local dealers and distributors); ii) industry associations; iii) tractor testing centers; iv) government authorities, such as the ministry of agriculture or the ministry of transport; and, v) national agricultural research institutes. Data were collected through interviews with respondents.
To make the data comparable across countries, several assumptions about the machinery company and the machinery product are used. Furthermore, only certain procedures are captured by EBA data, and specific rules are used to calculate time and cost. More detail on each issue, including the score assigned to each data point (table B.3) and specific terms, is set out below.

Assumptions about the importing business

**The business:**
- Is a private sector company (manufacturer, dealer or distributor of agricultural machinery).
- Is registered as a business in the country.
- Does not operate in an export processing zone or in an industrial estate with special import or export privileges.
- Uses the most-used seaport for importation of tractors in the country. If the country is land-locked, it is assumed that the most-used border posts are used.

Assumptions about the machinery product:

**The machinery product:**
- Is a two-axle or four-wheel drive agricultural tractor.
- Has more than 20 engine horsepower.
- Is designed to furnish the power to pull, carry, propel or drive implements.
- All self-propelled implements are excluded.

A tractor is used as a proxy to assess the enabling regulatory framework and the practices impacting access and use of agricultural tractors for farm mechanization.

Procedures

Procedures capture any required company interaction with external parties, such as ministries, government agencies, testing centers, accredited labs and so on to obtain a tractor type approval/homologation. Internal interactions among owners, managers and employees within the company do not count as procedures.

Time

Time is recorded in calendar days and captures the average duration of the company interaction with relevant agencies to obtain the tractor type approval or to obtain required licenses, permits and certificates.

Cost

Cost captures official fees and taxes associated with the tractor type approval/homologation or the licenses, permits and certificates, along with their required documents. All costs are recorded as a percentage of the country’s income per capita.

Specific terms

**Falling-object protective structures** (FOPS) are a system attached to the tractor to protect the operator from falling objects such as branches, rocks, and other falling objects.

**Roll-over protection structures** (ROPS) are attached to the tractor frame and come as either two-post fixed or foldable, four post, or as an integral part of a ROPS cab. They generally will limit a side overturn to ninety degrees ($90^\circ$) and will provide an important safety zone for the operator provided the operator is wearing a seat belt. Seat belts should not be used when a foldable ROPS is down or when a fixed ROPS is removed.

**Type approval** (also called *homologation*) is the official recognition given by a national authority or agency that certifies that the tractor conforms to the country’s prevailing regulatory, technical and safety requirements. Before the tractor can be sold on the market and before reaching the hands of the farmer, the manufacturer (or an agency on behalf of the manufacturer) must complete its type approval/homologation procedure and be certified by third-party verification that its design, construction and performance respect the country’s regulations and standards.

Finance

The finance indicators measure laws and regulations that promote access to a range of financial services, with a focus on areas that are particularly relevant for potential customers in rural areas. These customers are partially or fully excluded from traditional financial services due to factors such as their geographical location or available type of collateral.

Three indicators have been developed:

1. Non-bank lending institutions.
   - Operation and prudential regulations of microfinance institutions (MFIs).
   - Operation and governance of financial cooperatives.
2. Branchless banking.
   - Agent banking.
   - Electronic money (e-money).
3. Movable collateral.
   - Warehouse receipts.
   - *Doing Business*—Getting Credit.

Data for the finance indicators are obtained from three main types of respondents: financial sector supervisory authorities, financial lawyers, and legal officers of financial institutions. Data collections include interviews conducted during country visits directly with respondents, followed by rounds of follow-up communication via email and conference calls with respondents as well as with third parties. Data are also verified through analyses of laws and regulations, including a review of public information sources on banking law, warehouse receipt law, financial institutions law and others. More detail on each indicator, including the scoring methodology for each data point (table B.4) and specific terms, is set out below.
1. Non-bank lending institutions

This indicator measures regulations relevant to deposit-taking MFIs and financial cooperatives. Countries with a high level of financial inclusion will be scored only based on data on financial cooperatives, while the rest of the countries will be scored based on data on both MFIs and financial cooperatives. Finance indicators are designed to measure laws and regulations that promote access to financial services for potential customers that are partially or fully excluded from traditional financial services. In particular, the MFI and agent banking indicators focus on supporting the provision and proliferation of financial services to those who are excluded from traditional banking system. These indicators are not applicable to countries with a high level of financial inclusion where agribusinesses and smallholder farmers have few obstacles accessing the formal financial sector. Therefore, those countries are not measured under these indicators and the corresponding data for those countries are shown as “N/A” (not applicable).

The threshold used to establish what countries fall under those with a high level of financial inclusion has been determined as the average of the normalized values (0–1) of two variables, namely: “account at a financial institution (% of rural adult population),” and “account at a financial institution (% of adult population) based on the World Bank Findex database. Following this approach, those countries with a number higher than 0.8 on the average of normalized values of the above-mentioned two variables will be identified as countries with high level of financial inclusion. Countries under this classification are Denmark, Greece, Italy, Korea, the Netherlands and Spain.

To make the data comparable across countries, several assumptions about the financial institutions are used, as follows:

Assumptions about the financial institutions

**Microfinance institutions (MFIs):** MFIs are financial institutions that specialize in the provision of small-volume financial services (such as credit, deposits and loans) to low-income clients. MFIs can take deposits, lend, and provide other financial services to the public and are licensed to operate and are supervised by a public authority.

**Financial cooperatives:** Financial cooperatives are member-owned, not-for-profit, cooperatives that provide savings, credit, and other financial services to their members. There are typically two types of financial cooperatives, namely: i) small financial cooperatives that provide services only to their members; are typically supervised by either the central bank, the department of cooperatives, or the ministry of finance; and are referred to as savings and credit cooperatives (SACCOs) in some countries; and, ii) cooperative banks that take deposits from and lend to the public, and are regulated under the main financial institution laws and supervised by the central bank. The financial cooperative indicator does not measure cooperative banks but only small financial cooperatives to be consistent with the topic’s emphasis on small-scale lending and financial inclusion.

2. Branchless banking

The second indicator includes aggregated data related to agent banking and e-money. In this case, countries with a high level of financial inclusion will be scored only based on data on e-money, whereas the rest of the countries will be scored based on both agent banking and e-money.

3. Movable collateral

For the third indicator all countries will be scored on data on warehouse receipts. Data points from the Doing Business-Getting Credit indicator, including data on security interest granted to movable assets and future assets, collateral registry, and credit information from non-bank institutions, will be added to this indicator.

**Specific terms**

**Agent banking** is the delivery of financial services through a partnership with a retail agent (or correspondent) to extend financial services to locations where bank branches would be uneconomical.

**Capital adequacy ratio** (CAR) is a measure of the amount of a bank’s total capital expressed as a percentage of its risk-weighted assets.

**Effective interest rate** is the annual interest rate plus all fees associated with the administration of the loan to the client. It is a symbol of the total cost of the loan to the client. Proxies for the effective interest rate are the annual percentage rate or the amortization table/schedule for the loan.

**E-money** refers to money that is stored and exchanged through an electronic device. E-money is regulated and does not necessarily need to be associated with a deposit account at any financial institution. Examples include electronic funds transfers and payments processed through mobile phones or prepaid cards.

**Deposit-taking MFIs** are financial institutions specializing in the provision of small-volume financial services (for example, credit, deposits and loans) to low-income clients, which can take deposits, lend and provide other financial services to the public and are licensed to operate and supervised by a public authority.
Negotiable receipt allows the transfer of ownership without having to physically deliver the commodity.

Non-financial institution businesses are those that do not hold a financial institution license, including telecoms, post offices, or other businesses licensed by the central bank/financial supervisory authority to issue e-money.

Provisioning rules determine how much money banks must set aside as an allowance for bad loans in their portfolios. The share of a loan that must be covered by provisioning can either be the full loan amount or the part that is not secured by collateral (unsecured share).

Ratios to ensure financial stability can include the liquidity ratio, capital adequacy ratio, solvency ratio, credit to deposit ratio, assets to liabilities ratio, stable funding ratio, net loan receivables to total assets, and others. Countries address the issue of stability of financial cooperatives using different criteria, therefore all the above ratios can be included in this measure.

Warehouse receipts are documents issued by warehouse operators as evidence that specified commodities are of a stated quantity and quality, deposited or stored at particular locations by named depositors and owned by the beneficiary of the receipt issued. Where supported by an appropriate legal framework, warehouse receipts can serve as a form of collateral to obtain a loan from financial institutions and facilitate future sales.

Markets

The markets indicators monitor and analyze laws and regulations that can impact smallholder producers and agribusinesses when accessing domestic and foreign agricultural markets for their products.

Three indicators have been developed:
1. Agricultural trade.
2. Plant protection.
3. Producer organizations.

Markets indicators have five main types of respondents: (i) government agencies responsible for agricultural trade, plant protection and cash crops; (ii) private-sector agribusinesses producing and trading agricultural products in domestic and/or international markets, and related trade/export associations; (iii) farmers’ organizations, including unions, federations, cooperatives and other similar entities; (iv) chambers of commerce; and (v) lawyers. Data were collected from these respondents using three different surveys: one for the public sector and two for the private sector. Data were collected through interviews conducted during country visits directly with respondents and by email and teleconference calls from Washington, DC.

Details on the methodology for each indicator, including the score assigned to each data point (table B.5) and specific terms, are set out below.

1. Agricultural trade

To make the data on agricultural trade more comparable across countries, several assumptions about the business, the agricultural products, trading partner and shipment are used. Furthermore, only certain requirements are captured by EBA data, and specific rules are used to calculate time and cost.

Assumptions about the business

The business:
• Performs general agricultural trading activities.
• Does not directly engage in agricultural production, processing or retail activities.
• Does not operate in a special export processing zone.

Assumptions about the traded product and trading partner

A theoretical product and trading partner are selected for each country based on official export statistics in accordance with the following rules:
• The traded products are defined and grouped as cash crops, cereals, fruits and vegetables according to the Harmonized Commodity Description and Coding System 1996 version (HS 96).
• All data are sourced from the UN Comtrade Database, using the export data from 2009–13.
• For each country, the combination of the product and the partner country selected represents the highest five-year average export value (in US dollars). For example, cereal exports to Zimbabwe is selected for Zambia. In addition, the HS 4-digit product within the category that is exported the most to the partner country is used for studying the specific legal and regulatory requirements. For example, coffee exports (the top product within the cash crop category) to the United States is selected for Colombia.

Assumptions about the shipment

The shipment:
• Is transported via a 20-foot full container-load.
• Weighs 10 metric tons or costs US $10,000, whichever is most appropriate.
• All packing material that requires fumigation (such as wood pallets) is assumed to be treated and marked with an approved international mark certifying that treatment.

Requirements to trade

A “requirement” for purposes of the study is any legally required qualification or document that must be obtained by the business to buy or sell the selected
product in the domestic market or export the product to the trading partner. These requirements may apply to the trader (for example, a selling/buying license, periodic export registration, mandatory memberships, and so on) or to the export consignment on a per shipment basis (for example, phytosanitary certificate, quality certificate, and so on). These requirements involve interactions with external parties, including government agencies, inspectors and other relevant institutions. Buyer-driven requirements such as private laboratory tests are not considered for purposes of the study.

**The following principles apply to the requirements recorded:**

- Only requirements specific to the product group (or the top exported sub-product within that group) and agricultural products more generally are captured. Customs, commercial and shipping documents that are not specific in this way are not measured (for example, certificate of origin, export declaration, bill of lading, letter of credit, and so on).
- Mandatory membership of a public or private entity is included if it is required to obtain and exercise the right to export the selected product or agricultural products more generally.
- Trader-level licenses include any document or action that is required to obtain and exercise the right to buy or sell the product in the domestic market or export overseas, including registration or accreditation requirements and traditional licenses.
- Documents are collected on a per shipment basis, and one document includes both application and completion of the process (for example, obtain a phytosanitary certificate or obtain a quality certificate).
- Where multiple documents are obtained simultaneously, they are recorded as separate documents but time is adjusted to reflect their simultaneity.
- The mandatory documents required by both the country studied and the selected trading partner are included.
- Both public and private fumigation certificates are excluded if they are not required by the laws of either the country studied or the selected trading partner. Only fumigation that is required for the product itself is captured, and separate fumigation for packaging prior to its purchase/use is not included.

**Time**

Time is recorded in calendar days and captures the median duration to obtain each mandatory document to export on a per shipment basis. Time to complete membership requirements or to obtain trader-level licenses is not captured. The time span for each document starts with the first filing of the application or demand, and ends once the company has received the final document, such as the phytosanitary certificate. If time is obtained only in working days, the data are converted to calendar days based on the assumption that there are five working days per week and the procedure starts on a Monday. It is assumed that the company’s owners, managers or employees have had no prior contact with any of the officials and that the company completes each procedure to obtain the document without delay on its side.

**The following principles apply to how time to obtain documents is measured:**

- It is assumed that the minimum time required for each document is one day, except for documents that can be fully obtained online, for which the time required is recorded as half a day.
- Although multiple documents may be obtained (and related processes completed) simultaneously, the process to obtain each document cannot start on the same day (that is, simultaneous processes start on consecutive days).
- If the process to obtain a document can be accelerated for an additional cost and is available to all types of companies, the fastest legal process is chosen and the related costs are recorded. Fast-track options applying only to firms located in an export processing zone or to certain accredited firms under authorized economic operator programs are not taken into account.

**Cost**

The cost includes all official fees and fees for legal or professional services if such services are required by law to complete the qualification requirement or obtain a document. Service fees (for example, those charged by fumigation companies) are only included if the company is required by law to use such services. Traditional (scheduled) border taxes/tariffs are not captured. Other special charges or taxes that apply to the export product or sub-product, or the export of agricultural products generally, are included only where they result in the issuance of a stand-alone mandatory document to export or are conditional to obtain another mandatory document to export.

Where possible, laws, regulations and fee schedules are used as sources for calculating costs. In the absence of fee schedules, estimates by the public/private sector respondents are used. If several respondents provide different estimates, the median reported value is applied. In all cases the cost excludes bribes. All costs are recorded as a percentage of the country’s income per capita.

2. Plant protection

*Plant protection* encompasses regulations, policies and institutional frameworks that affect plant health in a country, including domestic pest management measures as well as phytosanitary controls at the
border. In cases where relevant regulations are specific to a product or product group, those applicable to the selected traded product are used.

3. Producer organizations

Producer organizations are also known as agricultural cooperatives, farmers’ cooperatives, farmers’ organizations or producer associations. A producer organization is defined as a formal, voluntary, jointly-owned and democratically controlled organization established for the economic benefit of agricultural producers by providing members with services that support farming activities, such as bargaining with customers or providing inputs, technical assistance, or processing and marketing services.

To render data on producer organizations comparable across countries, the following case study is used to select the most appropriate legal form in each country:

Several agricultural producers wish to pool their production within a producer organization to sell it on the spot market or through long-term sales contracts with buyers ("the transaction"). The principal function of the organization is to pool and sell the members’ production, and the organization takes ownership of the produce in question.

The following principles also apply:
- Voluntary and open membership;
- Democratic member control ("one member, one vote");
- Joint-ownership by members; and,
- Created to support and promote the economic interests of its members through joint economic activity.

If different forms of producer organizations exist in a country’s laws, the one which obtains the highest aggregated score under the producer organizations indicator is selected for inclusion in the dataset.

Specific terms

Definitions below are adapted from the International Plant Protection Convention (IPPC) website (http://www.ippc.int) and the International Standards for Phytosanitary Measures No. 5 Glossary of Phytosanitary Terms, adopted by the IPPC.

Electronic phytosanitary certificate (ePhyto) is the electronic version of a phytosanitary certificate in XML format. All the information contained in a paper phytosanitary certificate is also in the ePhyto. ePhytos can be exchanged electronically between countries or the data can be printed out on paper.

Pest risk analysis (PRA) is defined as “the process of evaluating biological or other scientific and economic evidence to determine whether a pest should be regulated and the strength of any phytosanitary measures to be taken against it.” It consists of three stages: initiating the process for analyzing risk; assessing pest risk; and managing pest risk.

Phytosanitary measures include “any legislation, regulation or official procedure having the purpose to prevent the introduction and/or spread of quarantine pests, or to limit the economic impact of regulated non-quarantine pests.”

Regulated quarantine pest refers to “a pest of potential economic importance to the area endangered thereby and not yet present there, or present but not widely distributed and being officially controlled.”

Transport

The transport indicators measure regulatory and administrative constraints affecting the provision of reliable and sustainable commercial road transport services.

The following two sub-indicators have been developed:

1. Truck licensing.
2. Cross-border transportation.

Data were collected through interviews conducted during country visits directly with respondents, by email and teleconference calls from Washington, DC, and by local staff in the different target countries. The topic mainly targeted private sector respondents including trucking associations, trucking companies and lawyers; and to a lesser extent, public sector respondents including ministries of transport, road transport regulatory authorities and ministries of infrastructure. Even though the questionnaire targeted both groups of respondents, time and cost information was typically answered by the private sector.

To make the data comparable across countries, several assumptions about the trucking company, its environment and scope of cross-border operations are used. Furthermore, only certain procedures are captured by EBA data, and specific rules are used to calculate time and cost. More detail on each issue, including the scoring methodology for each indicator (table B.6) and specific terms, is set out below.

Assumptions about the business

The business:
- Is a private entity or natural person whose core business is transporting goods by road for commercial purposes;
- Has met all formal requirements to start a business and perform general industrial or commercial activities;
- Is located in the country’s largest business city;
has no prior contact with any of the company’s owners, managers or employees has received the final document. It is assumed that the company’s owners, managers or employees have had no prior contact with any of the officials.

Cost
Costs capture only official costs required by law, including fees and taxes. Fee schedules in transport laws and regulations have been used as legal basis when available, and an estimation from qualified contributors in the alternative scenario. It is assumed that all documents have been submitted in the timely and correct form. All costs are recorded as a percentage of the country’s income per capita.

Validity
Validity is measured for domestic and cross-border truck licenses. Validity is expressed in years.

Specific terms
Backhauling rights: For example, when a truck registered in country A is able to transport agricultural goods into country B for sale, load other goods in country B and carry them back to country A.

Bourse de fret: A platform in which freight supply and demand are made publicly available for the purposes of freight access and allocation, often in the form of online service offered by a private company.

Certificate of good repute or equivalent: An official document issued by a competent judicial or administrative authority certifying that the trucking company was not convicted for a serious criminal offence or had not incurred in a penalty for a serious infringement of rules relating to road transport.

Cabotage rights: For example, when a truck registered in country A is able to pick up agricultural goods in country B and deliver them to a different point in country B.

Company-level license or permit: A special authorization required for established companies or individuals to legally transport goods (different from general business registration). It allows the company to operate several trucks under the same license.

Consignment note: A transport document attesting the nature and quantity of the goods transported when taken into charge by the carrier and attesting the delivery to the consignee.

Government registry or notification certificate, or equivalent: An official document issued by a competent administrative authority certifying registration in a road transport body.

Queuing system: A practice by which freight is sequentially allocated by trucking associations/unions or the government.

Transit rights: For example, when a truck registered in country A is able to travel through country B to deliver agricultural goods into country C (assuming foreign country B is the final destination of the foreign truck).

Transport/Import rights: For example, when a truck registered in country A is able to transport agricultural goods produced in its country into country B for sale.

Triangular rights: For example, when a truck registered in country A is able to pick up agricultural goods in country B and transport them to be delivered into...
country C (assuming foreign country B is the final destination of the foreign truck).

**Truck-level license or permit:** This is a special authorization required for a truck to legally transport goods (different from vehicle registration or technical inspection certificates). A truck-level license regime requires an individual transport license or permit for each truck.

**Water**

The water indicators measure laws and regulations that promote sustainable, inclusive and efficient governance of water resources, with a particular focus on the use of water for irrigation.

Two indicators have been developed:
1. Integrated water resources management.
2. Individual water use for irrigation.

Water indicators have three main types of target respondents: (i) lawyers specialized in water law and environmental law, both from private practice and the public sector; (ii) technical specialists in the field of water resources management, typically from the public sector; and (iii) academic experts. The questionnaire targets all three groups of respondents, whereby the legal questions are typically answered by lawyer respondents, and implementation questions are typically answered by technical specialists and academic experts. Data collection includes interviews conducted directly with respondents during country visits, followed by rounds of follow-up communication via email and conference calls with respondents, as well as with third parties. Data are also verified through analysis of laws and regulations and a review of publicly-available sources of information on water management and permits.

To make data for the individual water use for irrigation indicator comparable across countries, several assumptions about the water user and water source are used. More detail, as well as the score assigned to each data point (table B.7) and specific terms, is set out below.

**Assumptions about the water user**

**The water user:**
- Is a farm that grows crops.
- Is a medium-sized farm for the country, with land area that falls between 2 and 10 hectares.
- Uses mechanical means to individually abstract water for irrigation.
- Is not located in a broader irrigation scheme.

If medium-sized farms in the country, as prescribed in any official farm-size classification system, deviate significantly from this given range, it is assumed that the case study farm does not qualify for any exemption from permit requirements that may otherwise apply to small farms (such as exemptions for smallholders or subsistence farmers).

**Assumptions about the water source**

**The water source:**
- Is a river located 300 meters away from the farm; or
- Is a groundwater well located on the farm.

The choice between surface water and groundwater as a source for irrigation water is made based on the predominant irrigation water source for the country, determined using Food and Agriculture Organization (FAO) 2016 AQUASTAT data. The majority of EBA countries predominantly use surface water for irrigation; those with predominant groundwater use for irrigation are: Bangladesh, Denmark, India, Jordan, Nicaragua and the Netherlands.

**Specific terms**

**Abstraction and use permit** refers to the right to abstract and use a certain defined quantity of water resources. Depending upon the country context, permits may alternatively be referred to as authorization, license, right, concession and so on. For consistency, the term “permit” shall be used here.

**Basin institutions** are specialized entities that deal with the water resource management issues in a particular river basin, lake basin, or aquifer.

**Charges** refers to a fee or tax to abstract a certain volume of water as a natural resource, rather than a service charge for provided water or a one-time administrative application fee.

**Water conservation** refers to preservation and maintenance of the quantity and quality of water (surface and/or groundwater).

**Water efficiency** means to minimize water wastage in order to use the minimum amount of water required to perform a specific function.

**Water stress** “occurs when the demand for water exceeds the available amount during a certain period or when poor quality restricts its use.”

**Transfer** refers to when holders of water abstraction and use permits may sell, assign, trade, lease or otherwise transfer to a third party their permit.

**ICT**

The information and communication technology (ICT) indicator measures laws, regulations and policies that promote an enabling environment for the provision
and use of ICT services, with a particular focus on rural areas. The ICT indicator focuses on the regulations and policies to improve access to ICT services.

The ICT topic area has three main types of respondents, as follows: i) mobile operators; ii) ICT and/or telecommunication regulatory authorities; and iii) telecommunication lawyers. The questionnaire targets all three groups of respondents. Data were collected through interviews conducted during country visits directly with respondents and also by email and teleconference calls from Kuala Lumpur, Malaysia and Washington, DC.

The data points below (table B.8) measure the legal requirements to operate as a mobile service provider that offers core mobile services which include voice, SMS (Short Message Service) and/or data.

**Specific terms**

*Active infrastructure* sharing requires operators to share elements of the active network layer including, for example, radio access nodes and transmission.

*Digital dividend* is the amount of spectrum made available by the transition of terrestrial television broadcasting from analog to digital.

*Operating license* is a license that authorizes the provision of telecommunications services.

*Passive infrastructure sharing* is the sharing of space or physical supporting infrastructure which does not require active operational coordination between network operators.

*Service neutral* is any service that can be offered in the used frequency band.

*Technology neutral* is any available technology to date that can be employed to provide a certain service in the used frequency band.

*Voluntary spectrum trading* is a mechanism whereby rights and any associated obligations to use spectrum can be transferred from one party to another by way of a market-based exchange for a certain price.

<th>WHAT IS MEASURED</th>
<th>HOW IT IS SCORED</th>
</tr>
</thead>
</table>
| PLANT BREEDING | This indicator measures the regulatory good practices identified as supporting the plant breeding process. | 1. There is a regulation governing plant breeders’ rights | A score of 1 if yes  
A score of 0 if no |
| | | 2. The duration (in years) of the plant breeders’ rights (PBR) | A score of 1 if the protection lasts at least 20 years  
A score of 0 if the protection lasts less than 20 years |
| | | 3. Conditions to benefit from plant breeders’ rights do not differ between national and foreign applicants | A score of 1 if conditions do not differ  
A score of 0 if conditions differ |
| | | 4. A list of protected varieties is publicly available | A score of 1 if yes  
A score of 0 if no |
| | | 5. Companies are legally allowed to produce breeder/pre-basic seed of local public varieties for use in the domestic market | A score of 1 if yes  
A score of 0 if no |
| | | 6. Companies are legally allowed to produce foundation/basic seed of local public varieties for use in the domestic market | A score of 1 if yes  
A score of 0 if no |
| | | 7. Companies are obtaining access to germplasm preserved in publically managed gene banks | A score of 1 if yes  
A score of 0 if no |
| | | 8. Plant breeding rights can be licensed to another party for production and sale of the variety | A score of 1 if yes  
A score of 0 if no |
| | | 9. There are public research institutes in the country that license public varieties to companies for production and sale in the domestic market | A score of 1 if yes  
A score of 0 if no |
| | | 10. Companies importing germplasm for the development of new varieties are required to undergo government testing (other than phytosanitary tests) | A score of 1 if government testing is not required  
A score of 0 if yes, government testing is required |
| VARIETY REGISTRATION | This indicator measures the regulatory good practices identified as supporting the efficient registration and release of a locally developed new seed variety into the domestic market. It also measures the efficiency of the registration process through case studies. | 1. DUS testing data from other countries’ authorities are accepted as official data for the purpose of registration | A score of 1 if yes  
A score of 0 if no |
| | | 2. The law establishes a variety release committee (VRC) in the country | A score of 1 if yes  
A score of 0 if no |
| | | 3. The composition of the legally mandated VRC includes the private sector | A score of 1 if governmental and nongovernmental representatives (that is, seed associations, seed companies) constitute one-half or more of the VRC  
A score of 0.5 if nongovernmental representatives are included in the committee but constitute less than one-half  
A score of 0 if nongovernmental representatives are not included in the VRC or the VRC does not exist |
| | | 4. The frequency of VRC meetings | A score of 1 if the VRC meets on demand or at least once per cropping season  
A score of 0 if the VRC meets less than once per cropping season, or if the VRC does not meet at all |
| | | 5. A variety can be commercialized immediately after the decision of the VRC | A score of 1 if yes  
A score of 0 if no |
| | | 6. A catalog listing new registered varieties is publicly available online | A score of 1 if yes  
A score of 0.5 if the variety catalog is not available online  
A score of 0 if the variety catalog does not exist |
| | | 7. The variety catalog specifies agro-ecological zones suitable for the variety. | A score of 1 if yes  
A score of 0 if no |
| | | 8. The frequency with which the variety catalog is updated | A score of 1 if the catalog is updated each cropping season  
A score of 0 if the catalog is updated less than once a year |
| | | 9. Time to register a new maize variety | Total time required for all legally mandated procedures is aggregated and presented in calendar days.  
A score of 0 if there is no requirement to register or if the registration is not done in practice |
| | | 10. Cost required to register a new maize variety | Total cost for all legally mandated procedures is aggregated and presented in % of income per capita.  
A score of 0 if there is no requirement to register or if the registration is not done in practice |

(continued)

a Countries with a high level of financial inclusion are not measured under the operation and prudential regulation for MFIs sub-indicator.
b The methodology adopts the Basel Committee recommendation in “Microfinance activities and the Core Principles for Effective Banking Supervision” and the International Development Bank’s Jansson et al. (2004) “Principles and Practices for Regulating and Supervising Microfinance” report in establishing a CAR that falls within 2-3 percentage point of commercial banks or in the range of 10% to 15%.
c In some countries, the maximum loan an MFI can extend is limited to a percentage of deposits or a percentage of core capital. This language is included in risk management regulations, intended to limit the exposure of the institution to a single borrower. For countries with this type of loan limitation, EBA 2017 considers it "no limit" because the currency value corresponding to that percentage is so high as to present no effective limit to borrowers.
d Countries with high level of financial inclusion are not measured under the agent banking sub-indicator.

<td></td>
<td></td>
<td>A score of 0 if the constitution does not contain a clause on nondiscrimination</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>For the law on producer organizations:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>A score of 0.5 if the law requires producer organizations to comply with the principle of nondiscrimination and it mentions gender</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>A score of 0.3 if the law requires producer organizations to comply with the principle of nondiscrimination, but it does not mention gender</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>A score of 0 if the law does not require producer organizations to comply with the principle of nondiscrimination</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The 2016 data of Women, Business and the Law – Accessing Institutions are used as secondary data. The specific data points included: (1) whether the constitution contains a clause on nondiscrimination or not; and (2) if it exists in the constitution, whether the nondiscrimination clause mentions gender or not.
## Table B.6 | Scoring methodology for transport indicators

<table>
<thead>
<tr>
<th>INDICATOR</th>
<th>SUB-INDICATOR</th>
<th>DESCRIPTION</th>
<th>WHAT IS MEASURED</th>
<th>HOW IT IS SCORED</th>
</tr>
</thead>
</table>
| **TRUCK LICENSING** | Truck licensing (legal) | This indicator measures the regulatory and normative framework and associated efficiency to access and operate domestically within the road freight transport service market. Overall, the indicators determine the extent to which legal foundations provide for a clear, transparent and efficient system for accessing the market, guarantee a level playing field for competition, and dedicate special legal provisions for transporting agriculture and food products. | 1. Type of license legally required to transport goods commercially in the domestic market:  
   a. License at the company level  
   b. License at the truck level  
   c. Both at the company and truck level licenses  
   d. No license required | A score of 1 if only the company-level license is required  
A score of 0.5 if both company-level and truck-level licenses are required or only the truck license is required  
A score of 0 if no license is required |
| | | | 2. Validity of the relevant domestic license(s) is at least five years  
Note: If the country does not require a domestic license, the score of this question will read “N/A” | A score of 1 if yes  
A score of 0 if the validity is less than five years or N/A  
Note: If a country has “both” licenses, a score of 1 if both licenses have a validity of at least five years, and a score of zero if otherwise |
| | | | 3. Citizenship requirements do not apply to obtain a license (foreign nationals or businesses are allowed to obtain the relevant licenses)  
Note: If the country does not require a domestic license, the score of this question will read “N/A” | A score of 1 if yes  
A score of 0 if no or N/A |
| | | | 4. The law does not establish any of the following additional requirements to obtain a license:  
   a. Maximum number of trucks covered under the license  
   b. Maximum transported tonnage  
   c. Geographical operational limitations  
   d. Minimum number of trucks under the license  
   e. Licenses are only issued to members of a truckers’ association or professional body  
   f. Licenses cannot be issued to women  
   g. Obtain government registry or notification certificate  
Note: If the country does not require a domestic license, the score of this question will read “N/A” | A score of 1 if no additional requirements  
A score of 0 if any additional requirement or “N/A” |
| | | | 5. Documents required by law when transporting goods by road domestically include:  
   a. Written contract describing the conditions of carriage, including carrier’s liability for loss, damage or delay  
   b. Consignment note, packing list, bill of lading, waybill, commercial invoice or any other official document describing the goods shipped, their origin and destination | A score of 1 if documents listed under both (a) and (b) are required  
A score of 0.5 if yes only to either (a) or (b)  
A score of 0 if no documents are required by law when transporting |
| | | | 6. The law establishes specific regulations related to the transport of perishable agriculture products or foodstuffs, or related to the reference product | A score of 1 if yes  
A score of 0 if no |
| | | | 7. The law considers the following aspects as part of regulations for the transport of agri-food products:  
   a. Special conditions related to covering/roofing and flooring/insulation to protect loads from external and internal contaminants  
   b. Vehicle cooling, refrigeration or controlled-temperature aspects  
   c. Prohibition of co-mingling of certain items  
   d. Specific packaging, sealing and stowage conditions for the goods transported  
   e. Loading and unloading specific procedures  
   f. Mandatory cleaning and disinfection protocols and routines of truck container  
Note: If the country has no specific regulations for agricultural or food products, the score of this question will read “N/A” | A score of 0.166 for each aspect regulated  
A score of 0 for each aspect not regulated  
A score of 0 if “N/A” |

This appendix highlights two additional ways of presenting certain components of the EBA dataset.

Good practices related to nondiscriminatory measures and access to information are included in EBA topic scores. For example, the private sector’s eligibility to import fertilizer products is included in both the nondiscriminatory measures and the fertilizer topic score. Similarly, the existence of an online seed variety catalog is captured by both the access to information and the score of the seed topic.

**Nondiscriminatory measures**

The data on nondiscriminatory measures were collected across six EBA topics (table C.1). The total score of the 29 questions reflects the number of good practices related to nondiscrimination. These questions are also part of the corresponding topic and are scored based on the same methodology detailed in the data notes.

**Access to information**

The data on access to information were collected across seven EBA topics (table C.2). The total score of the 21 questions reflects the number of good practices related to access to information. These questions are also part of the corresponding topic and are scored based on the same methodology detailed in the data notes.

The fertilizer topic collected data on additional areas including competition, import and sale restrictions, subsidies and extension services. These areas were not scored since the evidence was anecdotal or no best practices could be identified to generate scores and trends at the global level.

Several questions were asked on competition issues, particularly if entities other than private companies are allowed or required to follow the same procedures as private companies to register, distribute or import fertilizer products. Evidence showed that in most instances the required procedures were uniform across countries for the private sector and other entities such as nongovernmental organizations (NGOs) and producer organizations/cooperatives. Different requirements existed only under special circumstances, most notably under subsidy programs, or where producer organizations were owned by the government and thus enjoyed the same privileges as the public sector.

Information on import and sale restrictions was also collected, including import bans on specific fertilizer types or products and country of origin. In addition, EBA looked at temporal import restrictions, company-level import quotas, restrictions on sales based on the type of products and geographical restrictions. In terms of specific fertilizer types or product restrictions, EBA found that most restrictions were based on health hazards that could be related to organic or bacterial content in the fertilizer product. EBA also found that some countries restrict fertilizers based on the country of origin and that subsidy programs often included specific conditions on imports. In general, no other restrictions were found in terms of products, geography or time of import.

Data were collected on subsidies, including the existence of subsidy schemes, subsidy targets (such as crops, products, farmer type or gender), subsidy administration models (reduced prices or vouchers) and timely duration of implementation (exit strategy). Although the data were not scored since there is no established best practice, EBA aims to contribute to

**Countries with subsidy schemes that are targeted**

**Countries with subsidy schemes that are not targeted**
the overall policy discourse by disseminating the information collected thus far.

Twenty-eight out of 62 countries surveyed have a subsidy scheme in place, among which half are in Sub-Saharan Africa (Figure D.1). The concentration of subsidy schemes in Sub-Saharan Africa is undoubtedly linked to the fact that countries in the region are among the lowest consumers of fertilizer overall.¹ As part of the debate on the effectiveness of subsidies, some countries are moving towards “smart” subsidies that have clear goals and targets.² Targeted fertilizer subsidy schemes often include more than one type of target. Of the 15 Sub-Saharan African countries, 12 target subsidies by crop and 11 target by specific type of fertilizer product. Ten of the countries also target the schemes based on the type of farmers, and four target based on the region. For example, in Malawi, subsidies target beneficiaries such as maize and tobacco farmers, and there is an exclusive poverty reduction objective through a program that focuses on smallholder farmers with food security issues. In Senegal, subsidies target small-scale family production of rice, maize, sorghum, millet, fonio, groundnuts, sesame, onion, tomato and watermelon.³

Machinery

Data were collected on additional areas that are critical to the machinery sector but that were ultimately not included in the topic scoring either because only anecdotal evidence was found, international best practices for these areas are not fully developed or government regulation is not always of direct relevance. Tractor hire and rental services, financing, taxes and duties on tractors and spare parts were all investigated, but not included in the final score.

Tractor hiring and rental services are crucial aspects of agricultural mechanization, given that not all farmers have the resources to invest in agricultural machinery, nor the need given the small size of their plots. Renting and hiring services therefore become the most realistic option for many farmers. In the majority of cases, these services are provided by private machinery owners and public hiring services have been largely unsuccessful.⁴ The data collected show that most of the countries studied have some form of tractor hiring or rental services available, either offered by public operators, private companies or individual tractor owners. The services offered typically include plowing, harrowing, planting and harvesting, with plowing being the service that is available in most countries. Given that tractor hiring and renting is generally not regulated by government, this aspect of agricultural mechanization was excluded from the topic scoring.

Access to finance is another major impediment to improving agricultural productivity in developing countries. Most farmers cannot afford to buy a tractor without financial assistance and many banks are reluctant to finance agricultural businesses due to associated risks. EBA findings on available tractor financing mechanisms are largely perception based and therefore have not been included in the scored indicators for this year’s machinery topic. However, the data collected indicate that of the three categories of financial assistance considered—(i) banks (private or public); (ii) leasing companies; and (iii) supplier credit—supplier credit stands out as the most restricted across regions. According to respondents, access to credit from banks
and leasing companies is also a major impediment in East Asia and Pacific and Sub-Saharan Africa regions, and respondents in other regions indicated moderate availability of these financing mechanisms.

Taxes and import duties imposed on agricultural machinery and spare parts have a direct bearing on the cost of tractors and create an unproductive financial burden on tractor maintenance. The data show that about one-fourth of countries studied levy low or no import duties on agricultural tractors, but high duties on replacement parts. This process has an adverse effect on the maintenance and repair of tractors because it increases operational costs and, in turn, hinders tractor utilization among farmers. The data collected also indicate that the prevailing tax regulations often lead to ambiguity and confusion over which tractor parts are tax exempted, as some parts are also used in the automotive industry, which typically attracts higher import duties.

Finance

This year the finance topic collected data on additional areas that are critical to agricultural finance, but for which international best practices are not fully developed. Partial credit guarantee systems (PCGSs) and agricultural lending quotas are two areas the finance topic studied, but did not score.

PCGSs can be a powerful tool to increase credit to agriculture. They reduce the risk that financial institutions take when lending to farmers and agribusinesses by acting as a collateral substitute, wherein “if the borrower fails to repay, the lender can resort to partial repayment from the guarantor.” However, the simple existence of a PCGS does not guarantee increased agriculture sector lending; rather, PCGS design and implementation have direct effects on program sustainability and effectiveness. Because there is no “one-size-fits-all” design for PCGSs, the team chose not to score this data. The data collected show that 18 of the 62 countries studied have a PCGS specific to agricultural loans issued by commercial banks. Only two high-income countries (Italy and Korea) have PCGSs. Sub-Saharan Africa is the region with the highest number of countries (6) with PCGSs, followed by Latin America and the Caribbean (4). Among the 18 countries with PCGSs for loans issued by commercial banks, only 8, most of which are located in Sub-Saharan Africa, also allow microfinance institutions (MFIs) to participate in the credit guarantee system—namely Bolivia, Colombia, Ethiopia, Mali, Mexico, Niger, Nigeria, and Rwanda. The finance topic also collected data on the implementation of mandatory quotas to encourage credit in the agricultural sector. There is strong evidence that suggest lending quotas for agriculture lead to low profitability for banks and high nonperforming loans, as well as misallocation of credit and distorted market dynamics. Nevertheless, some countries employ such interventions to support agri-finance. Data collected show that seven countries have policies requiring commercial banks to lend a percentage of their portfolio for the purpose of promoting agricultural activities—namely, Bangladesh, Bolivia, India, Nepal, the Philippines, Sri Lanka and Zimbabwe. The required percentage ranges from 2.5% of a bank’s total loans each year in Bangladesh, to 25% of total loans per year in Bolivia and the Philippines. Bolivia is the only country that also requires MFIs to lend a percentage of all loans to agriculture.

Transport

The transport topic collected data on other areas of relevance to the transport sector, including exclusions from licensing, electronic platforms, and quality criteria to address social and environmental concerns, although these areas could not be scored due to the absence of global best practices or low variance among countries. Countries often allow for various exceptions to transport licensing requirements, such as in cases where vehicles have a loading capacity less than 3.5 tons and where operators are transporting goods less than 10 kilometers or on their own account. Too many licensing requirements may generate high compliance costs for operators and lead to increased informality. Data show that out of 39 countries having at least one exception to regular licensing requirements, 20 exempt operators who transport goods on their own account, 15 exempt certain vehicles based on loading capacity and 7 exempt transporting goods over short distances. Because the need for these exceptions depends significantly on the specific country context, the data were not scored.

Electronic platforms can streamline processes and facilitate the authorization of transport licenses, particularly cross-border licenses, by allowing transport operators to apply for licenses and process payments remotely. Such systems can also reduce transport costs and contribute to transparency. Only two countries, Denmark and Spain, have electronic platforms in place for processing cross-border licenses.

The use of certain quality and safety criteria to obtain a trucking license and access the market may also be used by governments to counteract market failures and address negative externalities for society and the environment. The International Road Transport Union (IRU) states that “quality criteria of the access to the profession should always remain the core of any relevant legislation.” Such requirements can include the obligation for managers and drivers to obtain specialized training, demonstrate financial standing or possess a certificate of good repute. Good vehicle
standards include valid vehicle technical or emissions inspections certificates, third-party liability insurance and a vehicle registration certificate.

Bosnia and Herzegovina, Morocco and Thailand have strong legal frameworks that establish conditions to qualify for a truck license and operate a truck in public roads, including regular technical and emissions inspections, professional standards for truck owners or mandatory third-party insurance. While some countries such as Burkina Faso, Côte d’Ivoire and Serbia have embarked on a series of reforms to improve the qualifications of their truck operators and thereby the quality of trucking services, others such as Sudan or Zimbabwe do not have trucking regulations that ensure certain minimum standards are met to guarantee the formality or professionalism of operators. Countries with comprehensive licensing systems tend to have better quality control mechanisms for operators, suggesting that countries can promote market entry while improving standards in the sector. Countries such as Guatemala, Kyrgyzstan and Tajikistan do not have a minimum set of basic requirements such as third-party liability insurance or technical inspections. Guatemala is the only country in which technical inspections are not mandatory for heavy trucks, while Georgia established them in early 2016, bringing its regulatory framework in line with other countries in the Eastern Europe and Central Asia region.

Technical inspections are an important component of transport operations since they ensure safety and roadworthiness, and reduce negative externalities particularly related to the environment. If technical inspection certificates are valid only for a short period of time, however, this can increase costs for truck operators and may amount to rent-seeking in a country. Across the 61 countries mandating periodic vehicle technical inspections, 43 require inspections to be repeated annually, 13 require every 6 months, and the remaining six have various other validity periods. Given the different standards and procedures involved in each country’s vehicle inspections, there is no internationally accepted best practice in terms of the validity of technical inspection certificates. For example, some countries may impose a relatively low maximum age requirement for the truck at the time of applying for a license, and in such cases the validity of the technical inspections tends to be longer than in countries where trucks are generally older and require more frequent checking.

**Markets**

This year the markets topic continued to collect data on regulations impacting contract farming arrangements, but determined not to assign any scores due to methodological constraints and the lack of recognized regulatory best practices.

The concept of contract farming covers many different types of arrangements. Typically, a farmer or a group of farmers commits to provide, at a future date, an agreed quantity of a specific product that meets certain quality standards. In turn, the buyer commits to buy the product and, usually, to support production through the supply of farm inputs, the provision of credit, land preparation and/or the provision of technical advice. Evidence suggests that contract farming has been in use since at least the 19th century across various countries and sectors. Over time, contract farming has become more widespread and several studies indicate that it now governs more than one-third of agricultural production in the United States, three-quarters of Brazil’s poultry production and 40% of Vietnam’s rice sales; it has also emerged as a growing practice in China, India, Latin America and several African countries. The global spread of contract farming stems from a range of factors, but particularly from changes in consumer preferences and needs prompted by rising incomes and increased urbanization. This trend has led agricultural buyers to demand more from producers in terms of supply regularity, as well as safety and quality standards. Contract farming serves as a coordination model whereby the supply of agricultural products is timely, in sufficient quantity and of sufficient quality, and farmers can secure an outlet for their products and receive the inputs, credit and technical assistance necessary to meet buyer requirements. From a development perspective, contract farming has sparked the interest of donors, multilateral organizations and governments of developing countries as a way to link small-scale farmers to domestic and foreign markets, thereby contributing to poverty reduction.

The main challenge involved in developing a global indicator on contract farming relates to the lack of consensus on regulatory best practices, and this stems from the diverse and complex nature of contract farming arrangements in each country context. For example, Morocco’s law on contrats d’agréation agricole provides for highly formalized contract farming arrangements concluded between a contractor (“agrégeur”) and several producers (“agréés”) around a value-addition unit (“unité de valorisation”) for designated products. By contrast, in Cambodia, individual producers and buyers can conclude agricultural production contracts for any type of crop or animal product, and those contracts may take the form of market-specifications contracts, production-management contracts or resource-providing contracts. These contract farming laws differ in scope as they pursue policy goals that are context-specific, such as the focus on value-addition investments in the case of Morocco.
Furthermore, only a minority of countries has adopted laws and regulations that specifically address contract farming arrangements: 9 of the 62 countries analyzed this year have such rules, while the remaining 53 rely solely on general contract law and default rules that fill contractual gaps. There is no evidence to indicate that contract farming arrangements do better or worse depending on whether specific regulations exist. Proponents of the general contract law approach argue that the parties themselves are best-placed to define the contractual terms in their business relationships. In this context, soft law instruments, such as recommendations or codes of practices, may be more suitable than government regulations to promote fair and efficient contractual practices between producers and buyers of agricultural products. However, comparing and assessing those types of private sector- or civil society-led soft law instruments go beyond the scope of EBA’s focus on regulatory indicators.

Among the nine countries that have adopted contract farming regulations, certain “better” practices were identified. For example, all countries but Zimbabwe explicitly require contracts to be in writing, although in Zimbabwe the obligation on buyers to submit detailed schedules of their contractual agreements to the Agricultural Marketing Authority could serve the same purpose as written contracts. By contrast, of the 53 countries where contract farming arrangements are governed by general contract law, only 8 require that the agricultural production contract be made in writing and 6 have the same requirement for contracts above a certain amount. Written contracts can improve the clarity, completeness, and enforceability of the parties’ rights and obligations, and they serve an important evidentiary purpose in the context of any related court proceedings. Another key issue in the contract farming context relates to contract duration. Because agricultural production contracts may require significant investments and the crop production cycle may require a long-term relationship, a legal obligation to comply with a minimum duration can make up for a lack of or unclear contractual agreement on the timeframe to carry out certain performance obligations. Only 3 of 62 countries studied in EBA17 establish a minimum duration for agricultural production contracts and all of them have adopted laws that specifically address contract farming arrangements. In Morocco, for example, aggregation contracts must be concluded for a duration of at least five years, with the possibility to terminate them, while in India (Maharashtra), the mandatory minimum duration is set at one cropping season, without the possibility to terminate.

Four of the nine countries with specific contract farming rules have also established special commodity- or sector-specific institutions that offer alternative dispute resolution mechanisms to enforce agricultural contracts. Such tailored mechanisms can be particularly beneficial due to the sector-specific knowledge and expertise developed by the institution. In Cambodia, for example, the Contract-based Agricultural Production Committee, which is composed mostly of public sector representatives, is mandated to help solve any conflict or problem in the implementation of agricultural production contracts. In Zimbabwe, the Grain and Oilsseeds Technical Committee, in which private sector stakeholders are largely represented, determines any disputes arising from grain and oilseeds contracts, and its decisions can be appealed to the Agricultural Marketing Authority Board.
This year, the EBA water topic collected exploratory data on collective water use in irrigation schemes and, although it will not be scored this year, this information will inform the future development of a collective water use indicator, to mirror the current individual water use indicator. Across countries, many farms rely on large-scale, publicly provided irrigation schemes to supply water, and one trend in this realm is the development of water user organizations (WUOs). Alternatively known as irrigation associations, user associations, or water user associations, WUOs may be defined as “non-governmental organizations that farmers and other water users form to manage an irrigation system at the local or regional level.” Among the countries studied, 14 have enacted specific independent legislation to govern WUOs and another 31 have at least some mention of WUOs in their broader legal frameworks. Further information was collected on the establishment process, responsibilities, powers and membership requirements for decentralized management of irrigation infrastructure (figure D.2).

Moving forward, the water topic aims to further explore issues related to transboundary waters that span national borders and the interface between customary practices and legislative requirements for water management and use by smallholders. As a starting point, this year the water topic collected data on exemptions from permit requirements for smallholders. This area will be explored for possible expansion in coming years.

This year the information and communication technology (ICT) topic collected data on additional areas that impact access to ICT in rural areas, but ultimately these areas were not scored due to the importance of country context or because government regulation is not always of direct relevance. Universal access or service funds, programs aimed at reducing the cost of smartphone devices, and tariff plans to address the usage needs of rural subscribers were some areas that the ICT topic investigated.

The “last mile” of telecommunication infrastructure in rural areas is typically provided at a very high cost, which, in some cases, may not be commercially justifiable based on projected use and potential economic impact. Mobile and broadband service providers in rural areas often face high capital requirements and operating expenses, and have few incentives to invest given the relatively low rate of return as compared with more densely populated areas. One of the key challenges for governments, therefore, is to put in place appropriate financing mechanisms to support ICT development in rural areas.

Universal access/service funds are one of the most popular mechanisms for generating funds from multiple sources, including contributions from mobile operators, international organizations and government budgets. Mobile operators contribute to the universal access/service funds as part of their mandatory universal service obligations. In most countries, universal
access/service funds are created for ICT development projects that differ from country-to-country, depending on overarching policy goals.

Well-managed universal access/service funds help to expand ICT coverage in otherwise commercially unviable areas, but it is critical that the funds collected through the universal access/service funds are directed towards the development of ICT projects. Failures to disburse money point to weak governance and accountability structures in fund management and resource allocation. Efficient management of universal access/service funds is demonstrated by disbursing the money collected in a meaningful and transparent manner. Similar to this, details on a universal access/service fund’s projects and procedures should be provided to the public. Of the 62 countries studied, 36 have established a fund. Among these, five countries (Bangladesh, Burkina Faso, Cameroon, Egypt, and Niger) have operational funds that have never disbursed money for ICT development projects (figure D.3). Nine of the 36 countries with such funds (Guatemala, Mali, Morocco, Mozambique, Nepal, Sri Lanka, Sudan, Turkey, and Zambia) do not make any information on projects financed by the fund public.

Affordability greatly impacts the uptake of ICT technologies in the agriculture sector. The high costs of ICT solutions, including the costs of mobile devices (particularly smartphone devices) and mobile service charges, can be prohibitive for smallholder farmers, reducing their ability to capitalize on the benefits of mobile agriculture. Although countries differ in their needs and approaches to tackle affordability gaps, targeted interventions to alleviate costs can be critical in expanding farmers’ access to ICT. This is particularly the case in countries with large rural populations and high poverty levels.

Although governments often take the lead in initiatives to stimulate ICT access for undeserved communities, the private sector can also play a significant role. In Malaysia, for example, to accelerate the uptake of mobile broadband services, the Malaysian Communications and Multimedia Commission introduced the “Smart Device with Internet Package” initiative in 2014. The program aims at offering smartphones for subscribers in rural areas at a lower-than-retail price along with a mobile data subscription for one year. In India, the private sector has taken a greater role in expanding coverage to rural areas. Given the high proportion of the population living in rural areas and the proportionately low mobile internet market penetration, mobile operators have an incentive to unlock a high potential subscribers’ market. In a recent effort to increase coverage in remote areas, in 2008 Bharti Airtel Limited and the Indian Farmers Fertilizer Cooperative Limited (IFFCO) launched a joint venture that offers daily services tailored to farmers, including unique value-added services (for example, mobile applications) on commodity prices, farming techniques, weather forecasts, dairy farming, animal husbandry, rural health initiatives and fertilizer availability. Within the framework of this venture, Bharti Airtel provides lowered calling rates for calls between IFFCO members. As a result an estimated 200,000 new rural connections are activated per month. Similarly, in 2015 telecommunications operator BSNL Maharashtra developed the Maha Krishi Sanchar plan—a specifically designed, prepaid mobile tariff plan covering all farmers and employees of the State Department of Agriculture.

### Armenia

#### Seed
- Plant breeding index (0-10): 8.0
- Variety registration index (0-8): 6.5
- Time to register new variety (days): 587
- Cost to register new variety (% income per capita): 18.5
- Seed quality control index (0-12): 2.0

#### Fertilizer
- Fertilizer registration index (0-7): 0.0
- Time to register a new fertilizer product (days): N/A
- Cost to register a new fertilizer product (% income per capita): N/A
- Quality control of fertilizer index (0-7): 2.0
- Importing & distributing fertilizer index (0-7): 6.0

#### Machinery
- Tractor operation index (0-5): 0.5
- Time to register a tractor (days): 3
- Cost to register a tractor (% income per capita): 0.3
- Tractor testing and standards index (0-8): 5.0
- Time to obtain type approval (days): No practice
- Cost to obtain type approval (% income per capita): No practice
- Tractor import index (0-5): 5.0

#### Finance
- Branchless Banking
  - Agent banking index (0-5): 0.0
  - E-money index (0-4): 3.8
- Movable Collateral
  - Warehouse receipts index (0-5): 0.0
  - Doing Business - getting credit index (0-8): 4.0
- Non-bank Lending Institutions
  - Microfinance institutions index (0-7): 0.0
  - Financial cooperatives index (0-7): 5.0

### Markets
- Producer organizations index (0-13): 9.3
- Plant protection index (0-8): 3.5
- Agricultural trade index (0-9): 5.0
- Documents to export agricultural goods (number): 1
- Time to export agricultural goods (days): 1
- Cost to export agricultural goods (% income per capita): 0.0

### Transport
- Trucking licenses and operations index (0-11): 2.0
- Time to obtain trucking licenses (days): N/A
- Cost to obtain trucking licenses (% income per capita): N/A
- Cross-border transportation index (0-9): 5.0
- Time to obtain cross-border license (days): N/A
- Cost to obtain cross-border license (% income per capita): N/A

### Water
- Integrated water resource management index (0-29): 22.5
- Individual water use for irrigation index (0-20): 17.5

### ICT
- ICT index (0-9): 5.0

Enabling the Business of Agriculture 2017, the third report in the series, offers insights into how laws and regulations affect private sector development for agribusinesses, including producer organizations and other agricultural entrepreneurs. Globally comparable data and scored indicators encourage regulations that ensure the safety and quality of agricultural inputs, goods and services but are not too costly or burdensome. The goal is to facilitate the operation of agribusinesses and allow them to thrive in a socially and environmentally responsible way, enabling them to provide essential agricultural inputs and services to farmers that could increase their productivity and profits. Regional, income-group and country-specific trends and data observations are presented for 62 countries and across 12 topics: seed, fertilizer, machinery, finance, markets, transport, water, ICT, land, livestock, environmental sustainability and gender. Data are current as of June 30, 2016.
