#### Abstract

The March 2020 update to PovcalNet involves several changes to the data underlying the global poverty estimates. Some welfare aggregates have been changed for improved harmonization, and some of the CPI, national accounts, and population input data have been revised. This document explains these changes in detail and the reasoning behind them. In addition to the changes listed here, a large number of new country-years have been added, bringing the total number of surveys to more than 1,900 .

All authors are with the World Bank. Corresponding authors: Christoph Lakner (clakner@worldbank.org) and Minh C. Nguyen (mnguyen3@worldbank.org). The authors are thankful for comments and guidance received from Francisco Ferreira, Haishan Fu, and Carolina SánchezPáramo. We would also like to thank the countless Poverty Economists that have provided data and documentation, and patiently answered our questions. Without them the database of household surveys that underpins the World Bank's global poverty measures would not exist. This note has been cleared by Berk Ozler.
*January 2021 update:

- The table in Section 7.2 has been corrected. The previous version of the document stated that data for Somalia 2017 had been added. This is not the case.

The Global Poverty Monitoring Technical Note Series publishes short papers that document methodological aspects of the World Bank's global poverty estimates. The papers carry the names of the authors and should be cited accordingly. The findings, interpretations, and conclusions expressed in this paper are entirely those of the authors. They do not necessarily represent the views of the International Bank for Reconstruction and Development/World Bank and its affiliated organizations, or those of the Executive Directors of the World Bank or the governments they represent. Global Poverty Monitoring Technical Notes are available at http://iresearch.worldbank.org/PovcalNet/.

## 1. Introduction

The March 2020 global poverty update from the World Bank presents new poverty estimates for the reference year 2018, and revises the previously published global and regional estimates from 1981 to 2015. The update includes new surveys that have been received and processed, as well as several changes to the existing data. Some changes reflect improvements in the welfare aggregate based on new harmonization efforts and more available information. This document outlines the changes made to the underlying data by country, and explains the reasons why the changes have been made.

Table 1 shows the poverty estimates in 2018 for those regions that have sufficient population coverage. The data available at the time of the March 2020 update do not offer sufficient population coverage in 2018 for South Asia and Sub-Saharan Africa, so we are unable to publish regional poverty estimates for these two regions. ${ }^{1}$ Furthermore, since these regions account for most of the global poor in recent years, we are also unable to provide a global poverty estimate at this time. As further survey data in these two regions become available, we will update PovcalNet such that we can provide a global poverty estimate in the upcoming Poverty and Shared Prosperity report (to be published in the Autumn of 2020).

Table 1. Poverty estimates for reference year 2018, different poverty lines

| Region | Survey coverage (\%) | \$1.90 |  | \$3.20 |  | \$5.50 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Head- <br> count <br> ratio <br> (\%) | Number of poor (mil) | Headcount ratio (\%) | Number of poor (mil) | Headcount ratio (\%) | Number of poor (mil) |
| East Asia and Pacific | 91.9 | 1.3 | 28 | 7.6 | 159 | 25.6 | 532 |
| Europe and Central Asia | 87.5 | 1.2 | 6 | 4.5 | 22 | 12.1 | 60 |
| Latin America and the Caribbean | 86.6 | 4.4 | 28 | 10.4 | 66 | 24.2 | 154 |
| Middle East and North Africa | 50.9 | 7.2 | 28 | 19.8 | 77 | 44.8 | 174 |

| Sub-Saharan Africa | 36.4 | n/a | n/a | n/a | n/a | n/a | n/a |
| World Total | 61.5 | n/a | n/a | n/a | n/a | n/a | n/a |

Source: PovcalNet

[^0]East Asia and Pacific has continued on its downward trend, reducing the poverty headcount ratio at the international poverty line from $2.3 \%$ in 2015 to $1.3 \%$ in 2018, driven by decreases in poverty in China and the Philippines. ${ }^{2}$ In contrast, spurred by the conflicts in Yemen and Syria, the Middle East and North Africa region has seen a sharp reversal, with the poverty rate increasing from around $2.4 \%$ in 2011-2013 to $3.8 \%$ in 2015 and $7.2 \%$ in in 2018. In Latin America, poverty has largely stagnated, increasing slightly from $4.1 \%$ in 2015 to $4.4 \%$ in 2018, partially due to an increase in the number of poor in Brazil.

Table 2 illustrates the impact of the data updates on global poverty for the reference year 2015. The estimates for 2015 were first published in September 2018, and have since been revised in March 2019 and September 2019. With the new data, the estimate of the global $\$ 1.90$ headcount ratio increases very slightly, from $9.98 \%$ to $10.04 \%$ and the number of poor increases from 734 million to 737 million people. This change is largely explained by an increase in the regional poverty estimate for Sub-Saharan Africa, which in turn is explained by the availability of new survey data (e.g. Angola, Sudan and Tanzania etc.). These new surveys improve the precision of the reference year estimates in these countries, which were previously based on extrapolations of earlier surveys.

Previously, PovcalNet produced poverty numbers for a new reference year (also referred to as a "line-up year") with a three-year lag. For example, in 2018, we released global poverty estimates for 2015. There has been a growing interest in timelier poverty estimates to provide a more up-todate picture of poverty around the world. The main trade-off weighing against improved timeliness is the added imprecision in the lined-up poverty estimates: The closer the line-up year is to the present time, the further we have to extrapolate survey-estimates forward in time.

To gauge the relevance of this concern, and determine whether the merits to advancing the line-up by one year outweigh the increase in imprecision, we have tried to quantify the increase in the error we would expect from this. By error we mean the difference between the initially reported global/regional poverty estimates and the "final" poverty estimates once survey data before and after the line-up year have become available (we refer to this as the true estimate, although it is

[^1]obviously subject to various errors). The challenge with such an exercise is that we do not yet know the true poverty rate. We used two methods to approximate the increase in the error, as summarized below (section 6). Jointly, the methods suggest that the error in the global poverty headcount rate (at the international poverty line) is likely to increase somewhere in the range of 0 0.6 percentage points, with 0.15 percentage points being our best guess. We judge this to be small enough to merit advancing the line-up year and are reporting poverty estimates for 2018 with this update.

Table 2. Poverty at reference year 2015:

| Region | Comparison of September 2019 and March 2020 versions |  |  |  |  |  |  |  |  |  |  |  |

## 2. Changes to the welfare aggregates

### 2.1. Brazil 2012-2015

Since 2012, Brazil's Institute of Geography and Statistics (IBGE) has been undertaking a new survey called the PNAD-Continua (PNADC). Between 2012-2015, the new PNADC was collected in parallel to the traditional PNAD. PNADC incorporates improvements in survey methodology (including improved income questions and larger samples) relative to the PNAD. During this period of overlap, IBGE continued to rely on the PNAD for annual household welfare aggregates and used the quarterly PNADC for employment monitoring. In 2016, the PNAD was discontinued, and IBGE switched to using the income aggregate from the PNADC, without releasing the first four years of PNADC. Until this update, PovcalNet was also using the PNAD from 1981-2015 and the PNADC for 2016-2017.

In October 2019, IBGE published the PNADC series for 2012-2018, including the four years that overlap with PNAD. However, the 2012-2015 PNADC data that were released do not contain the variables necessary for imputing the rent of owner-occupiers. While the PNADC is an improvement over the PNAD in terms of survey methodology, the 2012-2015 data were published without dwelling characteristics, home ownership status, or housing rent amount. These are the variables that are used from the Socioeconomic Database for Latin America and the Caribbean (SEDLAC) for the rent imputation model used in other countries of Latin America and the Caribbean (LAC).

To create the longest possible time series that is comparable with the new PNADC used from 2016 onwards, the team developed and tested an imputation model that imputes rent into the PNADC for 2012-2015. In brief, the methodology is as follows (further details are available upon request):

1) Adjustments are made to the PNAD to construct an income variable that is more comparable with the PNADC. Since 2012, PNADC uses revised definitions of employment and labor income that are in line with the new guidelines published by the ILO.
2) The distribution of imputed rent is calculated in the PNAD for each year 2012 through 2015. ${ }^{3}$ Distributions are estimated separately for rural and urban populations.
3) Based on the distributions of non-zero household per capita income without rent $\left[y_{i}\right], 2,000$ bins are generated for rural areas and 4,000 bins for urban areas. For both rural and urban areas, one additional bin is generated that includes households with zero income. For each bin, the PNAD is used to estimate the average imputed rent for home owners $\mu_{r b}$ and the percent of households who are homeowners $\pi_{r b}$ (where $r$ refers to urban or rural, and $b$ is the number of the bin).
4) Homeownership and average imputed rent are then allocated to households observed in PNADC, such that each bin matches the $\mu_{r b}$ and $\pi_{r b}$ observed in PNAD. The allocation of homeownership is based on the results of a probit model run for each year, separately for urban and rural households. ${ }^{4}$ Based on this model, households with the highest likelihood of being homeowners are allocated home ownership and receive the average imputed rent among homeowners in that bin.

The final welfare aggregate is defined as

$$
\tilde{y}_{l}=y_{i}+\mu_{r b}\left[1_{\pi_{r b}}\right]
$$

where $1_{\pi_{r b}}$ takes the value 1 if the household is allocated home ownership and 0 otherwise.
5) This methodology was validated through two tests. First, we applied the methodology to the PNAD for which we can compare the original rent imputation methodology and this bin-imputation approach. Key poverty and inequality indicators are very close under the two approaches. Second, a cross-validation technique was used to test whether the model is properly imputing rent. The first validation relies on an "in sample" test, which is vulnerable to overfitting, especially as the number of bins increases. For the second test, the PNAD was divided into two samples: the training sample and the test sample. ${ }^{5}$ The

[^2]training sample was used to estimate the imputed rent for each bin. These values were then imputed into the test sample, and this sample was used to estimate the indicators. The results show no evidence of overfitting.

The revised data for Brazil uses the PNADC (including the rent imputation as described above) from 2012 to 2015.

|  | Poverty headcount \$1.90 |  | Poverty headcount $\$ 3.20$ |  | Gini index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| year | Sept 2019 | Mar2020 | Sept 2019 | Mar 2020 | Sept 2019 | Mar 2020 |
| 2012 | 3.8 | 3.8 | 8.7 | 9 | 52.7 | 53.5 |
| 2013 | 3.8 | 3.1 | 8.2 | 7.9 | 52.8 | 52.7 |
| 2014 | 2.8 | 2.7 | 6.9 | 7.1 | 51.5 | 52.1 |
| 2015 | 3.4 | 3.2 | 8 | 7.8 | 51.3 | 51.9 |

Note: Table presents poverty and inequality estimates for 2012 - 2015 as reported in this March 2020 release and as reported in our prior release from September 2019.

### 2.2. Brazil 2016-2017

IBGE released a new version of the 2016 and 2017 datasets in October 2019. The harmonization methodology has remained unchanged. The October 2019 data release changed 1) survey weights for 2012-2018 due to revised population projections, and 2) the identification and treatment of outliers in labor income for 2012-2019. Further details can be found in the technical notes on the IBGE website.

In the same release, IBGE also released the 2012-2015 and 2018 datasets for the first time (see above).

|  | Poverty headcount \$1.90 |  | Poverty headcount \$3.20 |  | Gini index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| year | Sept 2019 | Mar2020 | Sept 2019 | Mar 2020 | Sept 2019 | Mar 2020 |
| 2016 | 4.3 | 3.9 | 9.3 | 8.9 | 53.7 | 53.3 |
| 2017 | 4.8 | 4.5 | 9.6 | 9.1 | 53.3 | 53.2 |

Note: Table presents poverty and inequality estimates for 2016 - 2017 as reported in this March 2020 release and as reported in our prior release from September 2019.

### 2.3. Chile 2006-2017

The PovcalNet data for Latin America and the Caribbean are taken from the Socio-Economic Database for Latin America and the Caribbean (SEDLAC). SEDLAC has been developed by the Center for Distributional, Labor and Social Studies (CEDLAS) of the Universidad Nacional de La Plata in Argentina, in partnership with World Bank's Poverty and Equity Group's Latin America team. A process of methodological and technical revisions to the SEDLAC project started in 2015, to address several issues presented by users during the preceding five years. Additional changes were made to better align the SEDLAC data with the household survey harmonized by the World Bank for other regions. These revisions of the welfare aggregate represent a move from version 02 of the SEDLAC project, to version 03. For most countries in the region, PovcalNet moved from version 02 to version 03 as part of the April 2018 update. With this update, we are also implementing version 03 for Chile from 2006 onwards. The estimates in 2003 and earlier still use version 02 , and are therefore not comparable to the series beginning in 2006.

Three specific changes were made to the welfare aggregate for Chile:

First, the methodology used for imputing the rental value of owner-occupied housing was improved. It now includes households with a dwelling that has been received as a gift and those that live in usufruct, ceded dwellings. This change has led to increases in incomes for these types of households. The revision to the imputed rent methodology explains most of the change in the Chile series.

Second, the new series includes imputations for missing labor incomes, which has become more important due to rising non-response rates over the period. The imputed labor income variable has recently become available in the raw data, and the methodological details will soon become publicly available (to be published by the NSO on their website).

Third, the Chilean authorities have released more detailed variables. These variables allowed 1) the exclusion of the scaling up of individual incomes and rents to match National Accounts. 2) improved checks on the elements being included in the income aggregate (this revealed a case of inadvertent double counting in 2015, which led to a small error being corrected).

|  | Poverty headcount \$1.90 |  | Poverty headcount $\$ 3.20$ |  | Gini index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Year | Sept 2019 | Mar 2020 | Sept 2019 | Mar 2020 | Sept 2019 | Mar 2020 |
| 2006 | 2.4 | 1.5 | 7.4 | 5.5 | 48.2 | 47.3 |
| 2009 | 2.6 | 1.3 | 6.7 | 4.1 | 49.0 | 47.0 |
| 2011 | 1.6 | 0.6 | 4.7 | 2.6 | 47.6 | 46.1 |
| 2013 | 0.9 | 0.4 | 2.6 | 1.4 | 47.3 | 45.8 |
| 2015 | 1.3 | 0.3 | 3.1 | 1.1 | 47.7 | 44.4 |
| 2017 | 0.7 | 0.3 | 1.8 | 0.7 | 46.6 | 44.4 |

Note: Table presents poverty and inequality estimates for 2006 - 2017 as reported in this March 2020 release and as reported in our prior release from September 2019.

### 2.4. Honduras 2016

Weights were adjusted according to population projections based on the 2013 Census. This ensures comparability of the 2016 data with the 2014, 2015, 2017 and 2018 surveys.

|  | Poverty headcount \$1.90 |  | Poverty headcount \$3.20 |  | Gini index |  |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Year | Sept 2019 | Mar 2020 | Sept 2019 | Mar 2020 | Sept 2019 | Mar 2020 |
| 2016 | 16.0 | 18.0 | 30.0 | 32.9 | 50.1 | 51.1 |

Note: Table presents poverty and inequality estimates for 2016 as reported in this March 2020 release and as reported in our prior release from September 2019.

### 2.5. LIS

We continue to use the Luxembourg Income Study (LIS) for the following seven economies ${ }^{6}$ : Australia, Canada, Germany, Israel, Japan, South Korea, and United States. With this update we have also added data for Taiwan, China.

For the countries that use EU-SILC in recent years (typically from the early 2000s), we have added LIS data in the earlier years. This improves the population coverage of our database in the 1980s and 1990s, especially for the economies in the "Other High Income" group. These new data, however, introduce a break in comparability, usually in the early 2000s, when we switch from LIS to EU-SILC. Users should bear this in mind when analyzing country trends, and they are advised

[^3]to use the comparability database that is released together with the global poverty data (see Atamanov et al. 2019, blog, data and Section 5 below). The comparability database accounts for the break between LIS and EU-SILC. More generally, for all LIS surveys, we have added a break whenever the name of the underlying survey changes, given limited information on comparability in the LIS documentation.

All LIS data have been downloaded on 6 February 2020. As before, we use disposable income per capita from the LIS data in the form of 400 bins (see Chen et al., 2018 for more details).

### 2.6. Mexico 2016

Four households in the surveys were classified as non-coherent households due an inconsistency of the income variables, that was not identified previously. These households have very high incomes, so removing them lowers the Gini index considerably, while the poverty measures remain unchanged.

|  | Poverty headcount $\$ 1.90$ |  | Poverty headcount $\$ 3.20$ |  | Gini index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Year | Sept 2019 | Mar 2020 | Sept 2019 | Mar 2020 | Sept 2019 | Mar 2020 |
| 2016 | 2.2 | 2.2 | 7.9 | 7.9 | 48.3 | 46.3 |

Note: Table presents poverty and inequality estimates for 2016 as reported in this March 2020 release and as reported in our prior release from September 2019.

### 2.7. Papua New Guinea 1996

The previous version of the Papua New Guinea 1996 data included duplicate households. This has now been corrected.

|  | Poverty headcount $\$ 1.90$ |  | Poverty headcount $\$ 3.20$ |  | Gini index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Year | Sept 2019 | Mar 2020 | Sept 2019 | Mar 2020 | Sept 2019 | Mar 2020 |
| 1996 | 53.2 | 51.0 | 70.8 | 73.6 | 55.4 | 45.8 |

Note: Table presents poverty and inequality estimates for 1996 as reported in this March 2020 release and as reported in our prior release from September 2019.

### 2.8. EU-SILC

All historical EU-SILC data have been updated to data released in December 2019. The updates for each country-year are documented on the Eurostat website [CIRCABC $\rightarrow$ Eurostat $\rightarrow$ EUSILC $\rightarrow$ Library $\rightarrow$ data_dissemination $\rightarrow$ udb_user_database].

Previous versions of PovcalNet used 400 bins generated from the EU-SILC microdata (similar to how the LIS data are being used, see Chen et al., 2018 for more details). With this update, we are using the full EU-SILC microdata. Pending further research on harmonizing the treatment of negative incomes across our database, we exclude households with negative incomes. In contrast, the World Bank's Poverty and Equity Portal, as well as its Shared Prosperity Database, include negatives. This can explain some of the differences in the estimates presented in the different databases.

### 2.9. Uruguay 2000-2017

The thirteenth salary (or Christmas bonus, aguinaldo in Spanish) is now included correctly in the income variable. In the previous version, this component of labor income was included only for individuals interviewed in July and January. In the revised version, it is included for individuals interviewed at any point during the survey.

| 2017 | 0.1 | 0.1 | 0.4 | 0.4 | 39.50 | 39.46 |

Note: Table presents poverty and inequality estimates for 2001-2017 as reported in this March 2020 release and as reported in our prior release from September 2019.

## 3. Changes to CPI data

The baseline source of CPI data has been updated to the IMF's International Financial Statistics (IFS) as of 4 November 2019. Lakner et al. (2018) provide an overview of the various CPI series that are used in PovcalNet. Table A. 1 in the Appendix to this note gives the up-to-date source of the deflator for all countries included in PovcalNet as of the current update.

## 4. Changes to National Accounts Data

The national accounts data used to adjust survey data to reference years have been updated. Methodological details and choice of data sources are available in Prydz et al. (2019). The primary series is national accounts data from WDI February 2020, supplemented with historical data from the Madison Project Database. A full overview of national accounts data used in the update, including special series, is available in Appendix 2.

## 5. Comparability database

Since September 2019, we provide metadata on comparability of poverty estimates within countries over time. The assessment of comparability is country-dependent and relies on the accumulation of knowledge from past and current Bank staff in the countries, as well as close dialogue with national data producers with knowledge of survey design and methodology (see Atamanov et al. 2019, for more information on reasons that break comparability).

With this data update, we have also revised the comparability database. Changes in the comparability database arise from the introduction of new years in the database or the revision of previously published data (as documented above). For example, the revision of the Chile series introduces a break in 2006. The introduction of LIS data for the countries that use EU-SILC in later years, also introduces a new break for these countries. As described above, the comparability database accounts for the break between LIS and EU-SILC. More generally, for all LIS surveys, we have added a break whenever the name of the underlying survey changes, given limited information on comparability in the LIS documentation.

The updated comparability database can be accessed here:
https://datacatalog.worldbank.org/dataset/comparability-over-time-country-level-international-poverty-measures
More information on how to use the database is available in Atamanov et al. (2019), this blog and this replication code.

## 6. Methods for estimating the error from advancing the line-up year

As summarized in the Introduction, we use two methods to assess the added imprecision to the global poverty estimates from advancing the line-up year by one year. The first method tries to estimate what the impact of advancing the line-up year by one year would have been if we had done so in the past. Suppose we are in March 2010 and decide whether to use 2007 or 2008 as the line-up year. We can estimate what our estimate of global poverty for 2008 would have been in 2010 by neglecting all data after 2008, which arguably would not have been processed and be ready for a March 2010 update. Next, we can compare that to our current 2008 global estimate of poverty. This will reveal how far off our initial estimate was from the final estimate (which for simplicity we refer to as the "true" estimate here). We can do the same for 2007 and then derive how much the error would have increased if we had reported 2008 poverty numbers rather than 2007 in 2010. We can repeat this exercise for other years. In some years, advancing the line-up year by one year would have increased the error in the global poverty rate by 0.6 percentage points, equivalent to about $3.5 \%$ of the actual poverty estimate. Other years it would hardly have mattered. The increased error mostly comes from South Asia and Sub-Saharan Africa, where advancing the line-up year by one year would have increased the error in the regional poverty rates by up to 2 percentage points.

The second method gets around the problem that we do not know the difference between the initially reported lined-up estimate and the true estimate by trying to predict these differences for each country. We do so in the following way. For all past surveys in PovcalNet, we take the observed poverty rate and calculate the poverty rate using PovcalNet's extrapolation method supposing the survey had not been present. The error is the absolute difference between the two. We can use this to get a sense of what has determined the country-level line-up errors in the past.

We use a random forest model to predict the errors as a function of the extrapolation time, the poverty rate, mean consumption, the Gini, GDP per capita, whether income/consumption is used, the region, the growth rate between the two surveys, and whether the two surveys are comparable. The poverty rate of the country as well as the extrapolation time between the two surveys matter the most for the error in lined-up poverty rates. We can use the model to predict the error in the lined-up poverty rate for each country for each line-up year under consideration. For example, the model predicts that the absolute difference between the true poverty rate and the extrapolated poverty rate for Namibia is 2.0 percentage points if 2017 is the line-up year and 2.4 percentage points if 2018 is the line-up year. By taking the population weighted average by region and globally we can estimate the impact of increasing the line-up year from 2017 to 2018. Doing so suggests that changing the line-up year from 2017 to 2018 increases the error in the poverty headcount ratio (at the international poverty line) by about 0.15 percentage points globally, and by about 0.3 percentage points in South Asia and Sub-Saharan Africa.

## 7. Economy-years added/removed

### 7.1. Economy-years removed

## Lesotho 2010

The data collection of the 2010-11 wave of the CMS/HBS faced several challenges concerning missing values in core consumption items. As an interim solution, a survey-to-survey imputation exercise was carried out to impute household expenditures and estimate poverty in 2010, utilizing the 2002-03 wave of the HBS. For several years, the imputed consumption aggregate has been used in PovcalNet. Since full consumption data were collected in 2017/18 (CMS/HBS 2017/18), the 2010 imputed data have been removed.

### 7.2. Economy-years added

The table below gives the list of new economy-years added to the PovcalNet database. Two new economies have also been added for the first time: Taiwan, China and United Arab Emirates.

| Economy | Years | Survey Name |
| :--- | :--- | :--- |
| Albania | $2014-2017$ | HBS |
| Angola | 2018 | IDREA |

## 9. Appendix 1 - CPI Data sources

Table A1.1 lists the source of CPI used for each economy-year reported in PovcalNet. The columns in the table are defined as follows:

- Code: The 3-letter economy code used by the World Bank: https://datahelpdesk.worldbank.org/knowledgebase/articles/906519-world-bank-countryand-lending-groups
- Economy name: Name of economy
- Year(s): Welfare reporting year, i.e. the year for which the welfare has been reported. If the survey collects income for the previous year, it is the year prior to the survey. This is identical to the year variable used in PovcalNet.
- CPI period: Common time period to which the welfare aggregates in the survey have been deflated. The letter Y denotes that the CPI period is identical to the year column. When the welfare aggregate has been deflated to a particular month within the welfare reporting year, the month is indicated by a number between 1 and 12 , preceded by an M , and similarly with a Q for quarters. The letter W indicates that a weighted CPI is used, as described in equation 1 in Lakner et al. (2018).
- CPI source: Source of the deflator used. The source is given by the abbreviation, the frequency of the CPI, and the vintage; e.g. IFS-M-201911 denotes the monthly IFS database version November 2019. For economy-specific deflators, the description is given in the text or further details are available upon rfinterequest.

## 10.Appendix 2 - National Accounts Data Sources

This appendix provides details of national accounts data used in aligning estimates to reference years (see Prydz et al, 2019 for methodological details). The primary source of national accounts data in this update is the February 2020 version of the World Development Indicators. For historical data this is supplemented with the Madison Project Database (MDP), 2018 version, for years prior to 2000.

In addition, the following special economy series are used:

- Angola: GDP data for the year 2019 is used from WEO October 2019, since they are not available in WDI.
- Djibouti: GDP data from May 2018 WDI is used from 1990 to 2015. From 1987 to 1989, September 2006 WDI is used. From 2016 to 2018, the IMF’s World Economic Outlook (WEO) October 2019 is used.
- India 2011-2015: As before, the reference year estimates for India from 2012 to 2015 are based on a method which adjusts HFCE growth by incorporating findings of a poverty imputation for 2014.5. Growth rates in national accounts are adjusted to match the results from the poverty imputation. The method is described in greater detail in Chen et al (2018) and Newhouse and Vyas (2018).
- Iran: GDP from February 2020 WDI is used until 2017. For 2018, WEO October 2019 is used.
- Liberia: GDP from October 2019 WDI is used from 2001 to 2018. For the earlier years, November 2018 WDI is used.
- South Sudan: GDP from December 2017 WDI is used until 2015. From 2016 onwards, WEO October 2019 is used.
- Syrian Arab Republic: The GDP series for the Syrian Arab Republic has been revised and updated to 2018. The availability of growth estimates in a conflict setting such as Syria is scarce, so we are forced to combine several sources: WDI June 2016 is used up to 2007. It is then linked with growth rates (in real per capita GDP) based on the WEO October 2019 (2008-2010), Gobat and Kostial (2016) (2011-2015) and Devadas et al. (2019) (20162018).
- Taiwan, China: GDP from WEO October 2019 is used.

A complete overview is available in Table A2.1 (GDP per capita) and Table A2. 2 (HFCE per capita).

[^0]:    ${ }^{1}$ Survey coverage is assessed within a two-year window either side of 2018, i.e. including surveys that were conducted between 2016 and 2020 (also see Chen et al., 2018). The estimates for South Asia and Sub-Saharan Africa are not displayed since these regions have a survey coverage less than $40 \%$.

[^1]:    ${ }^{2}$ The estimates before 2018 are available in PovcalNet, as well as the $\underline{R}$ and Stata packages.

[^2]:    ${ }^{3}$ In the case of Brazil, the value of rent for homeowners is estimated using a quantile regression model. This is described in Atamanov et al. (2018).
    ${ }^{4}$ The variables used are household head's years of schooling, age, and gender; household composition (number of children in the household, number of household members, and whether a spouse is present), and state fixed effects. The probit estimator was used separately for models of urban and rural areas.
    ${ }^{5}$ Since the imputation model relies on dividing the data into urban and rural areas, the samples were drawn so as to be balanced over rural and urban areas.

[^3]:    ${ }^{6}$ The term country, used interchangeably with economy, does not imply political independence but refers to any territory for which authorities report separate social or economic statistics.
