Interregional Resource Transfer and Economic Growth in Indonesia

Toshihiko Kawagoe

Rapid economic growth in Indonesia starting in the 1970s was fueled by market-based resource transfers, which helped modernize regional economies, creating the driving force for industrialization; and more welfare-oriented, government-based resource transfers, or development spending, which favored the poorer outer islands.

February 1998
Summary findings

In 1970, Indonesia was a poor agricultural state, with a per capita GNP of only US$80 — the lowest among Asian economies and substantially lower than such African countries as Kenya and Ghana. Agriculture — with about 50 percent of GDP and 66 percent of the labor force — was the dominant sector.

In the 1970s, however, Indonesia showed rapid economic growth (5 percent a year). Softened world oil markets brought a slowdown in growth in the early 1980s, but growth recovered and per capita GNP in 1994 was US$880, comparable with the Philippines and substantially higher than many South Asian and African countries. Agriculture had only a 22 percent share of GDP; industry, 41 percent; and services, 42 percent.

But Indonesia is enormously diverse and some parts of it did much better economically than others. As the country’s economy grew, market-based resource transfers helped modernize regional economies, creating the driving force for industrialization. By contrast, government-based resource transfers, in the form of development spending, were more welfare-oriented, favoring the poorer outer islands (and did not contribute to industrialization).

In other words, economic growth was sustained by two driving forces, government- and market-based transfers, which complemented each other. The oil boom was a bonanza, producing new fiscal revenue, a luxury only oil-exporting countries could enjoy. It is not always a ticket to successful industrialization, as the tragic experiences of such oil-exporting economies as Mexico show.

Inter-regional Resource Transfer and Economic Growth in Indonesia¹

Toshihiko Kawagoe
Faculty of Economics, Seikei University

1. Introduction

In 1970 Indonesia was one of the low income countries having only a GNP 80 US dollars per capita, which was the lowest among Asian economies and substantially lower than that of African countries, such as Kenya and Ghana.² Like other low income economies, agriculture was the most dominant sector in the Indonesian economy, occupying around 50 percent of the GDP and 66 percent of the total labor force.

¹ This paper is a result of a research project, supported by Japan Center for Economic Research, Export-Import Bank of Japan and Overseas Economic Cooperation Fund, and presented at the World Bank workshop held May 5 - 6, 1997. The author wishes to thank Alberto Valdés, Peter Timmer, Gustav Ranis, Farrukh Iqubal, Juro Teranishi, Cristina David, Ronald Zavislak, Koichi Sakamoto for very helpful comments and suggestions. The usual disclaimers apply.

² Per capita GNP in 1970 U.S.$, shown in the parentheses, was Ghana (250), Kenya (130), India (110), Bangladesh (100), Philippines (230) and Thailand (210). Source: World Bank, World Table 1992, Table.1.
